

# Visual Representation from Semiology of Graphics by J. Bertin

Slides by: Sheelagh Carpendale

# From a communication perspective

“Communication is too often taken for granted when it should be taken to pieces.” (Fiske’91)

## Two basic schools of thought

### 1. Process

- the common sense approach
- concerned with the transmission of messages
- senders and receivers encode and decode
- message is transmitted through some media (TV, voice, hair style, etc.)
- to communicate is to effect another’s state of mind or behaviour
- effect should as intended, no intention -> no communication
- involves examination of transmission and explanations of failure
- sender responsible/ receiver viewed as quite passive

# From a communication perspective

“Communication is too often taken for granted when it should be taken to pieces.” (Fiske’91)

## Two basic schools of thought

### 2. Semiotics

- a study of signs and the cultures that use them
- a **sign** is defined as **anything that stands for something other than itself**
- an exchange of meaning
- recognition that people understand a given set of signs differently
- alternate interpretations rather than failures
- a message is made up of signs, signs are then interpreted
- interpreter/receiver/user rises in importance
- reading becomes active, discovering meaning, putting signs together in terms of ones background and culture
- different readings possible, in fact probable.

# Creating a visualization

1. Understand a **system of related information** and **tasks**.
2. Create a **mapping** from the **data** (digital representation) to a **visual representation**.
3. **Present** this visual representation on the computer screen.
4. Provide **methods of interacting** with this **visual representation** that can include methods for varying the **presentation** and methods for varying the **representation**.
5. **Verify** the usefulness of the **representation**, the way it is **presented** and/or and its **interaction** methods.

# What is meant by representation?

- Fuzzy general usage, common mis-definition - “ $A$  represents  $B$  to the extent that  $A$  resembles  $B$ ”
  - does one twin represent their sibling?
  - does one item of the assembly line represent another?
  - does a painting of Churchill represent him?
- Solving a problem simply means representing it so as to make the solution transparent ... (*Simon, 1981*)
- Useful representations
  - allow people to *find* relevant information
    - information may not be present
    - information may be present but hard to find
  - allow people to *compute* desired conclusions
    - computations may be difficult or “for free” depending on representations

# Creating Visual Representations

- A practical look at how to create the visual mapping that is capable of communicating
- to communicate with words we first need to know phonemes, the letters and how they combine to create words
  - note that phonemes and letters are meaningless in themselves
- are there corresponding visual units?
  - there is still considerable debate on this subject
- in the meantime, we will look at a practical approach of how we can create visual representations that can be understood.

Jacques Bertin

# Bertin's disclaimer

- **Bertin considers**
  - printable, on white paper,
  - visible at a glance
  - reading distance of book or atlas
  - normal and constant lighting
  - readily available graphic means

# Where does one start?

- with marks!
  - for us, pixels
- Visual Variables: how can we vary marks?
  - by where we place them
  - by how we place them (Bertin calls this ‘implantation’)
  - by their visual characteristics (Bertin calls these retinal variables)

# The Plane

- **Points**

- “A point represents a location on the plane that has no theoretical length or area. This signification is independent of the size and character of the mark which renders it visible.”
- a location
- marks that indicate points can vary in all visual variables

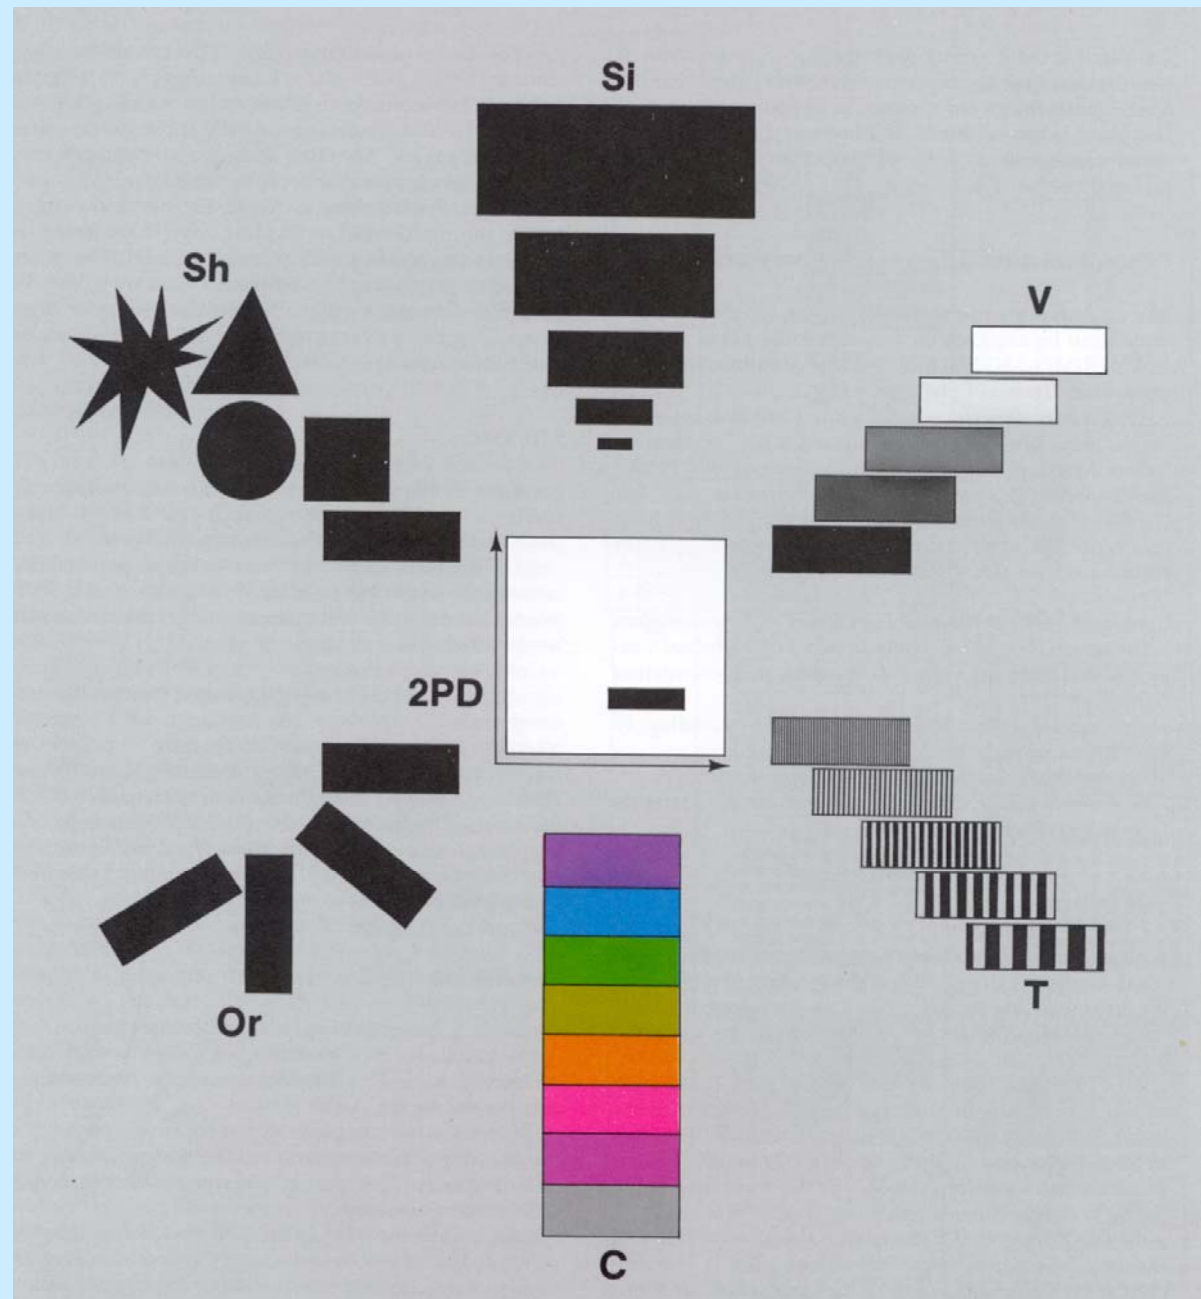

- **Lines**

- “A line signifies a phenomenon on the plane which has measurable length but no area. This signification is independent of the width and characteristics of the mark which renders it visible.”
- a boundary, a route, a connection

- **Areas**

- “An area signifies something on the plane that has measurable size. This signification applies to the entire area covered by the visible mark.”
- an area can change in position but not in size, shape or orientation without making the area itself have a different meaning

# Visual Variables

# Visual Variables

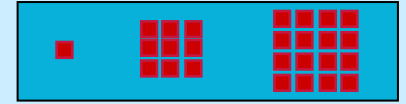

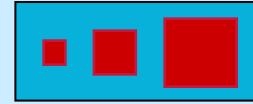

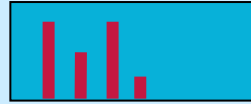

- **position**

- changes in the x, y, (z) location

- **size**

- change in length, area or repetition

- **shape**

- infinite number of shapes

- **value**

- changes from light to dark

- **orientation**

- changes in alignment

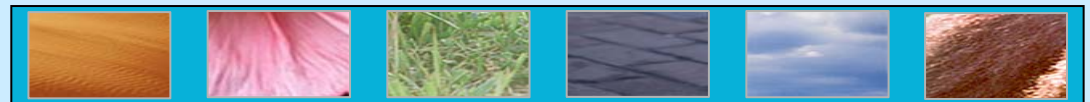

- **colour**

- changes in hue at a given value

- **texture**

- variation in pattern

- **motion**

# Visual Variables on a computer?

- **motion**
  - direction, acceleration, speed, frequency, onset, ‘personality’
- **saturation**
  - colour as Bertin uses it largely refers to hue, other readily available colour channels (i.e. saturation)
- **flicker**
  - frequency, rhythm, appearance
- **depth? ‘quasi’ 3D**
  - depth, occlusion, aerial perspective, binocular disparity
- **illumination**
- **transparency**

# Visual Variables

## Characteristics of visual variables can be

- **selective**

is a change in this variable enough to allow us to select it from a group?

- **associative**

is a change in this variable enough to allow us to perceive them as a group?

- **quantitative**

is there a numerical reading obtainable from changes in this variable?

- **order**

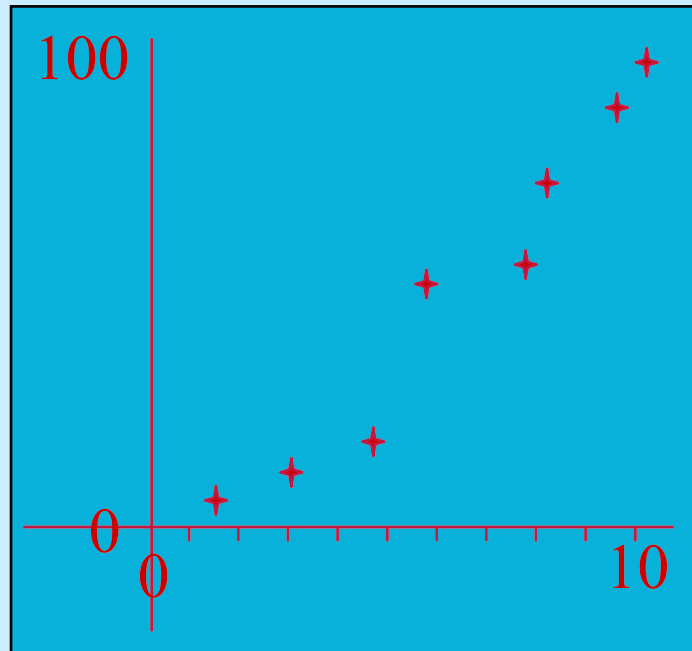

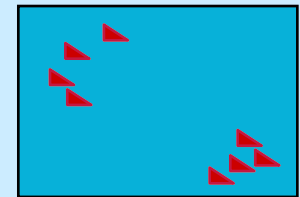

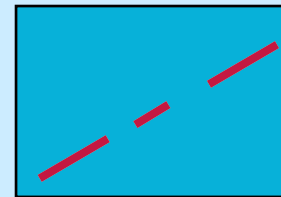

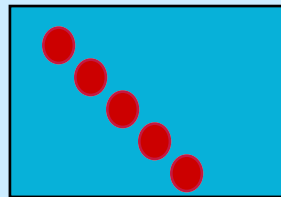

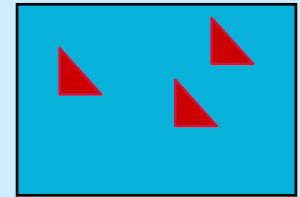

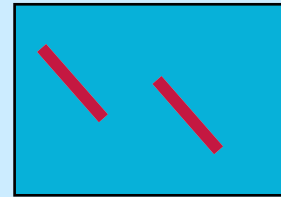

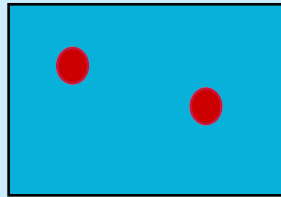

are changes in this variable perceived as ordered?

- **length**

across how many changes in this variable are distinctions perceptible?

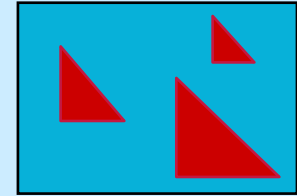

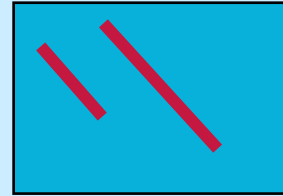

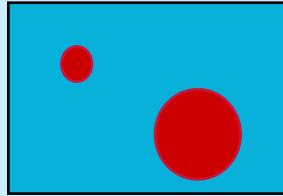

# Visual Variable: Position

- ✓ • selective
- ✓ • associative
- ✓ • quantitative
- ✓ • order
- ✓ • length

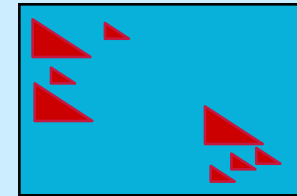

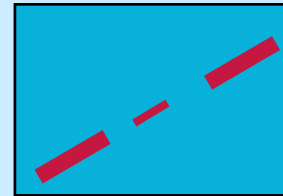

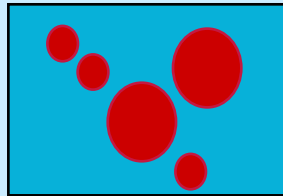

# Visual Variable: Size

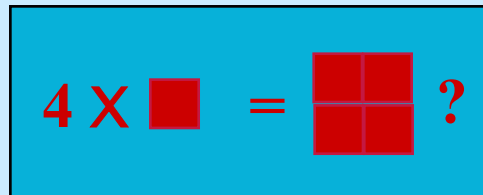

✓ • selective

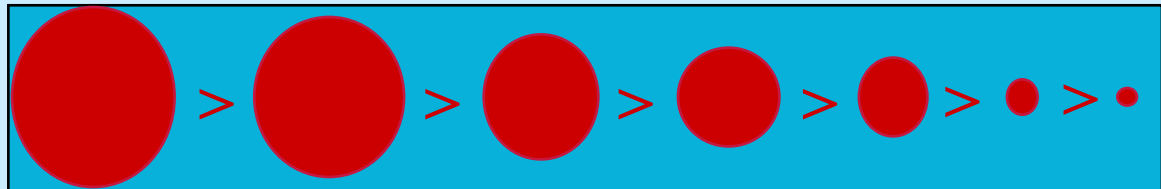

✓ • associative

~ • quantitative

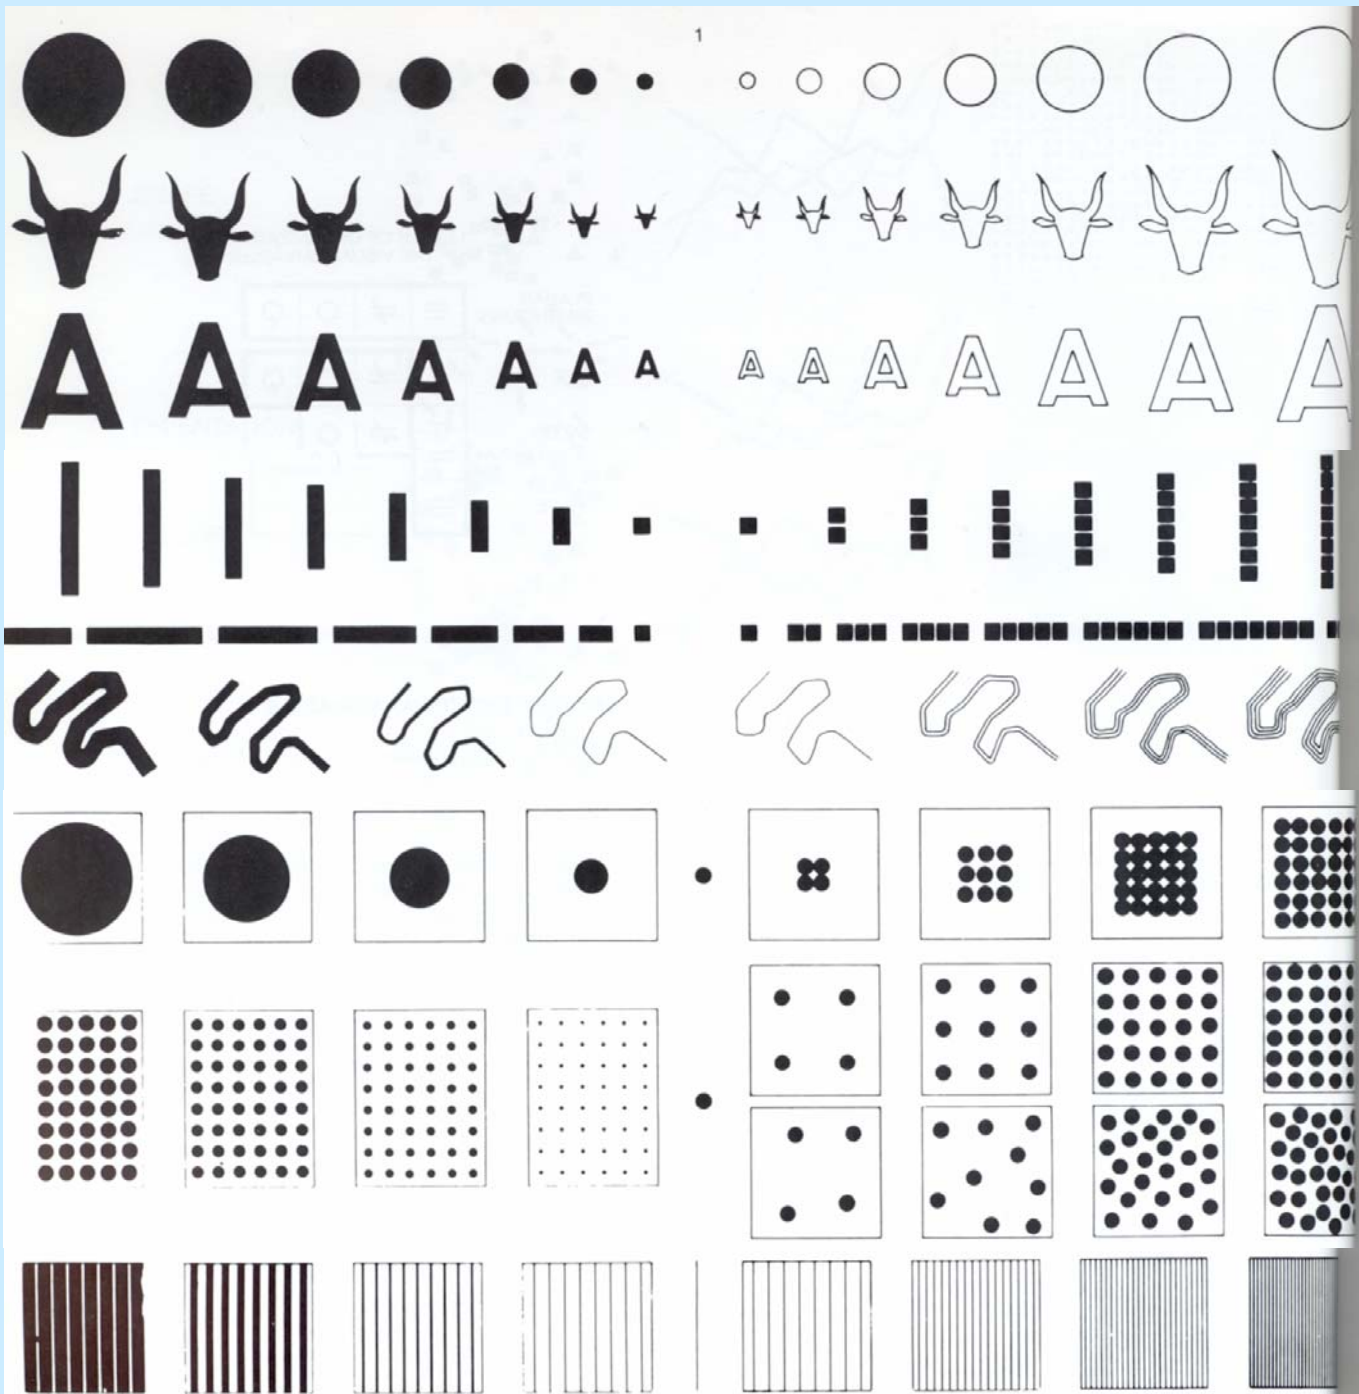

✓ • order

✓ • length

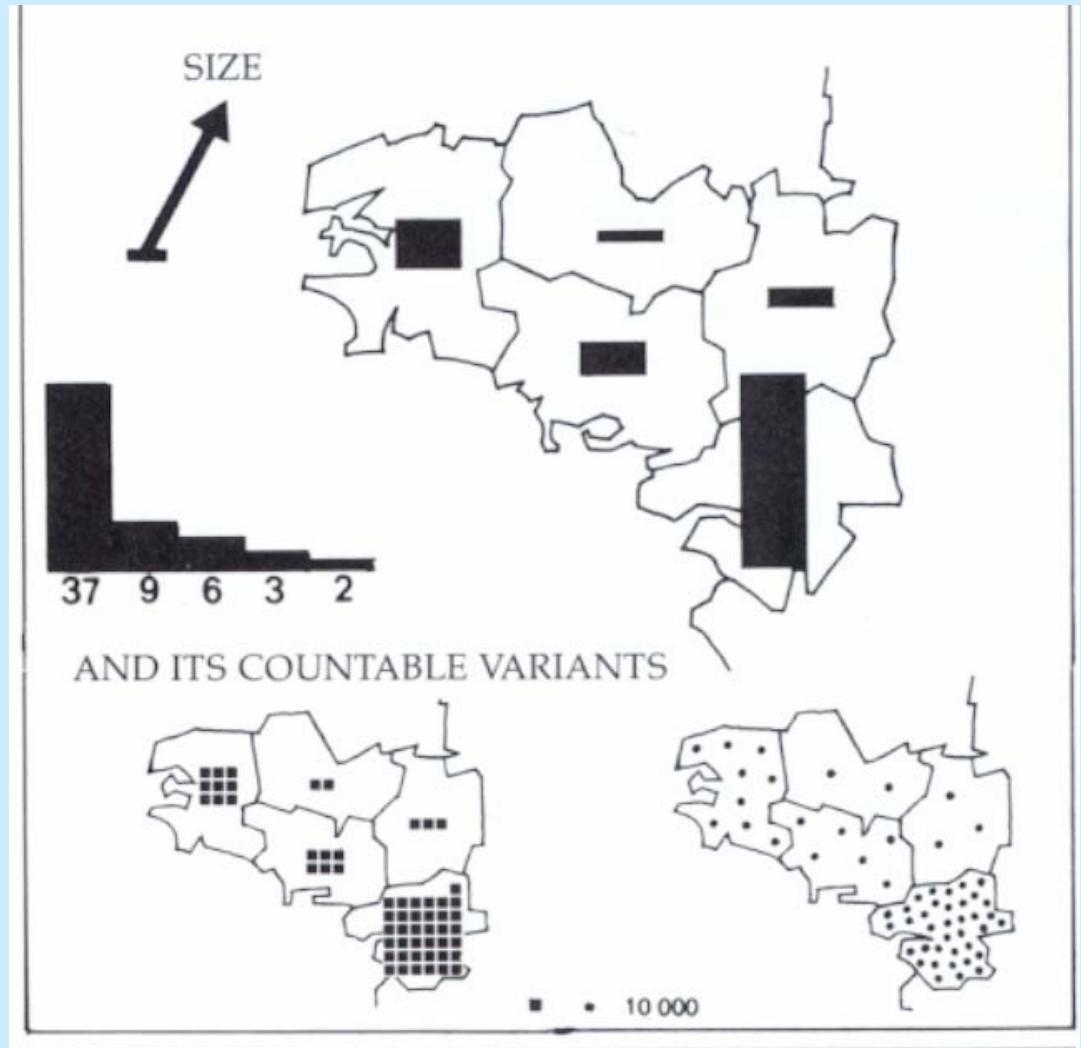

- theoretically infinite but practically limited
- association and selection ~ 5 and distinction ~ 20

VV:  
Size

# Size

- Categories of size,
  - height of a column,
  - area of a sign,
  - number of equal signs

# Size

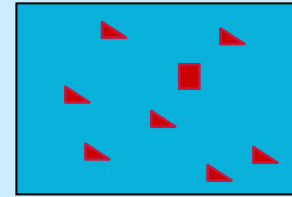

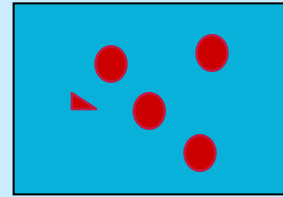

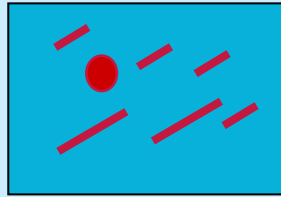

points

lines

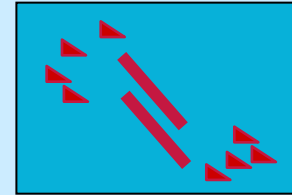

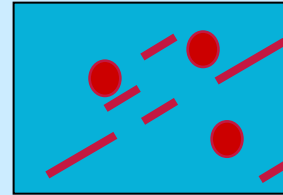

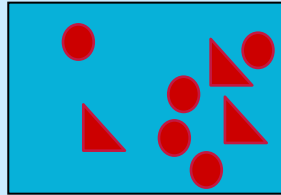

areas

# Visual Variable: Shape

 • selective

 • associative

 • quantitative

 • order

 • length

• infinite

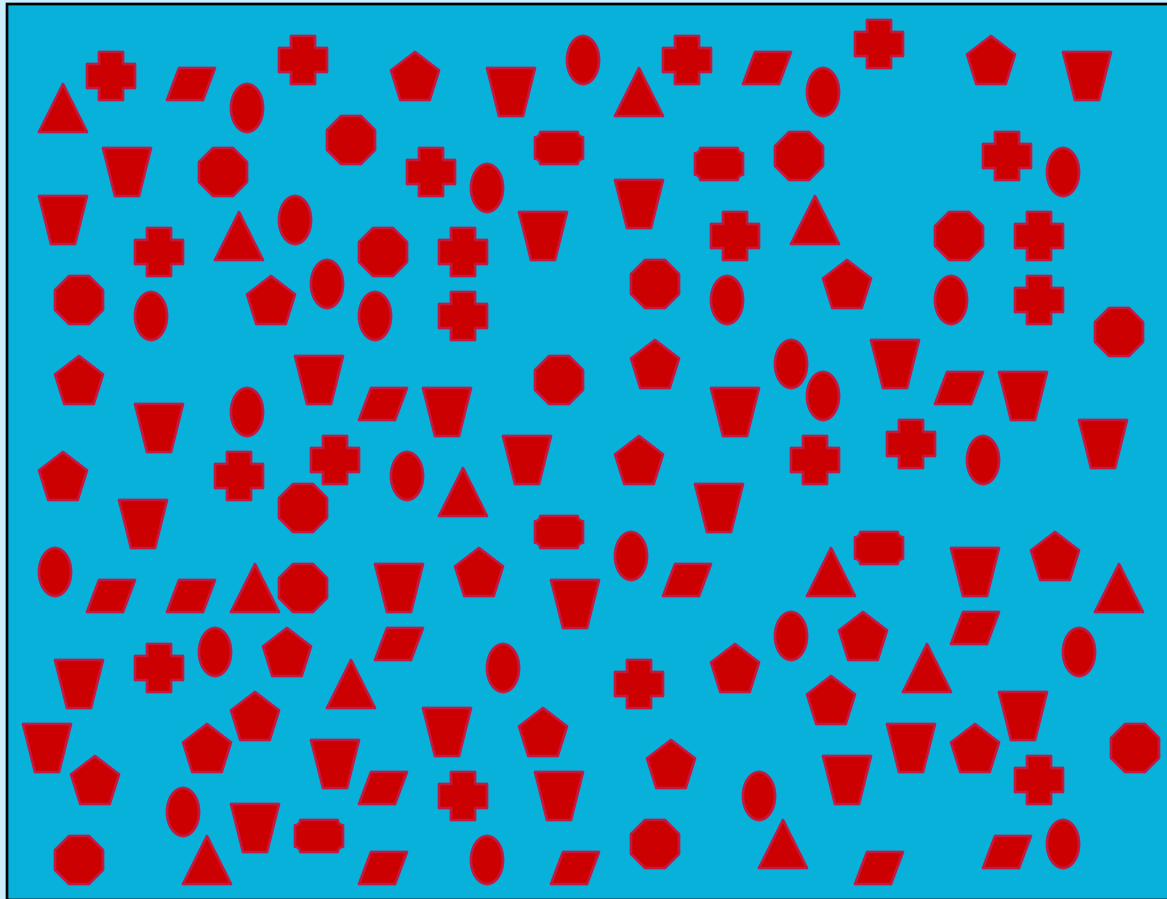

# Shape

- Constant size variation in shape
- Quantity is read through the legend

# Shape

# Shape

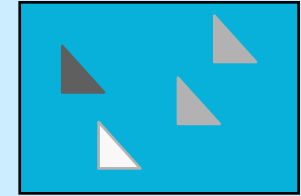

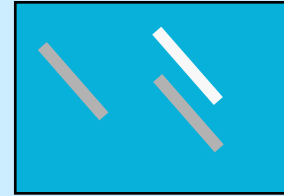

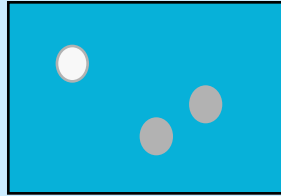

points

lines

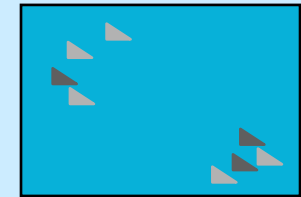

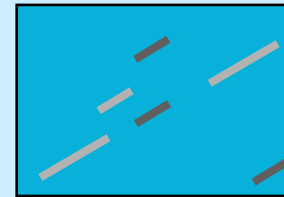

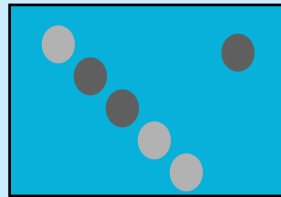

areas

# Visual Variable: Value

✓ • selective

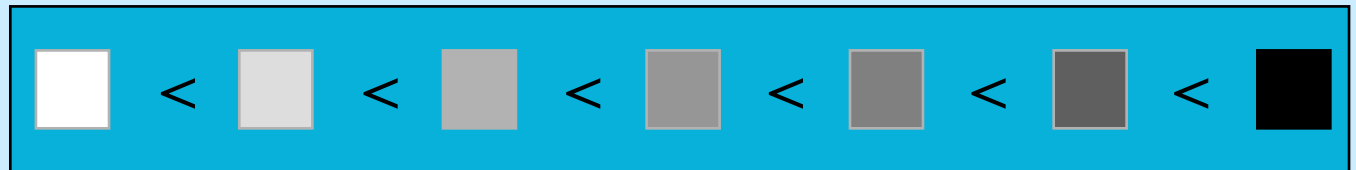

✓ • associative

✗ • quantitative

✓ • order

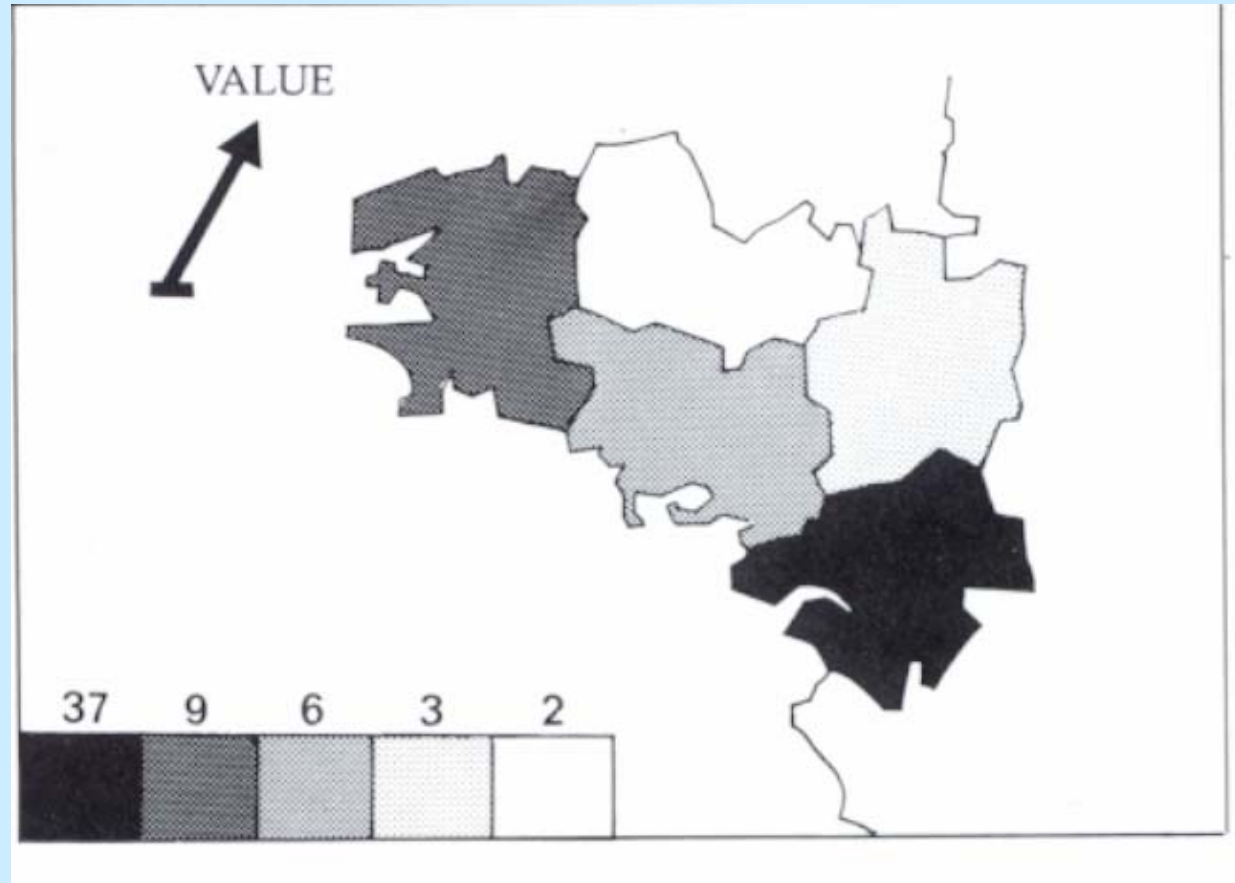

✓ • length

- theoretically infinite but practically limited
- association and selection  $\sim < 7$  and distinction  $\sim 10$

# Value

- Categories of value,
  - various degrees between black and white,

# Value

points

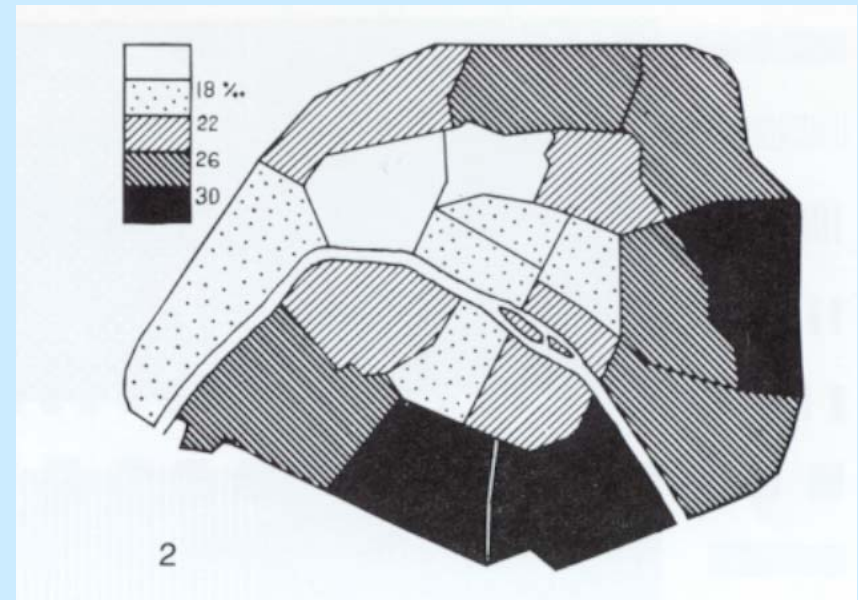

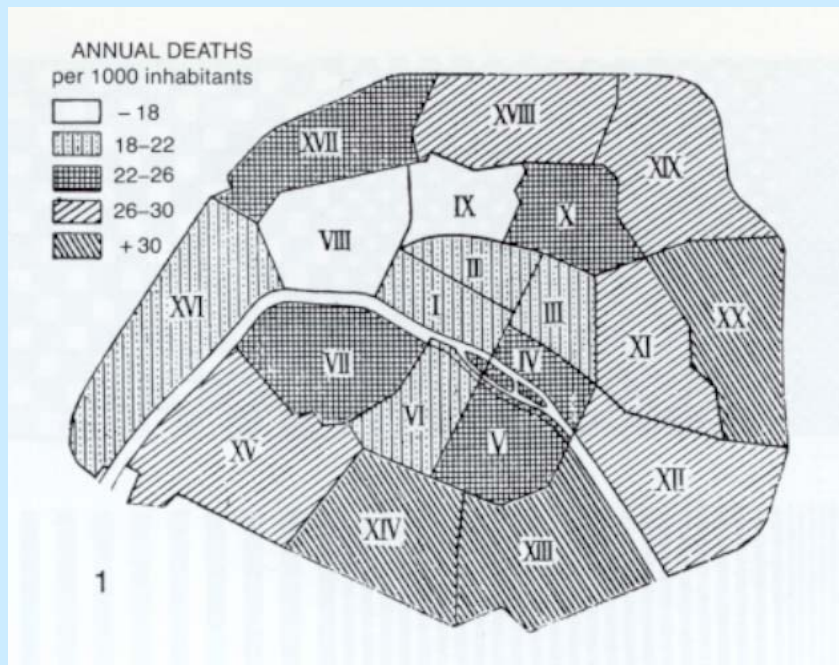

lines

areas

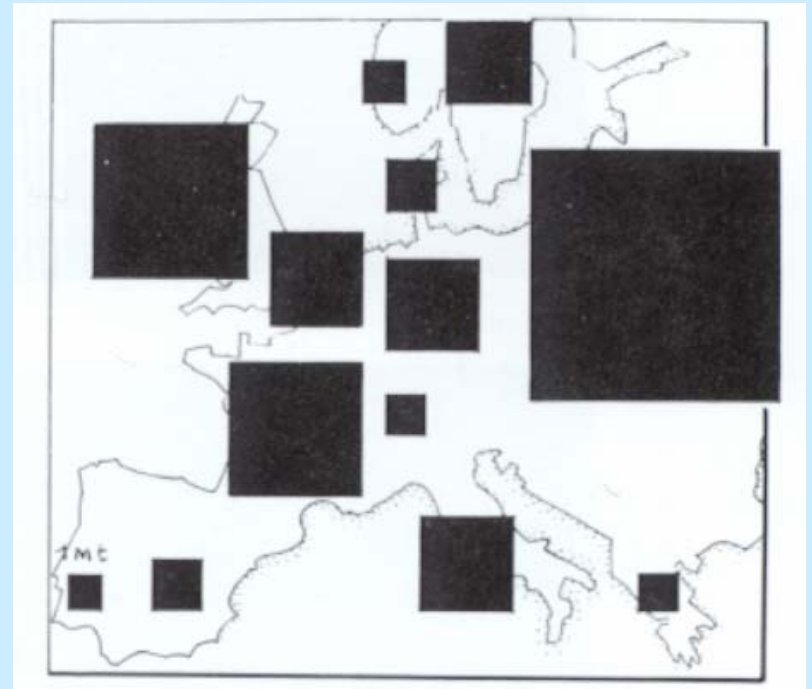

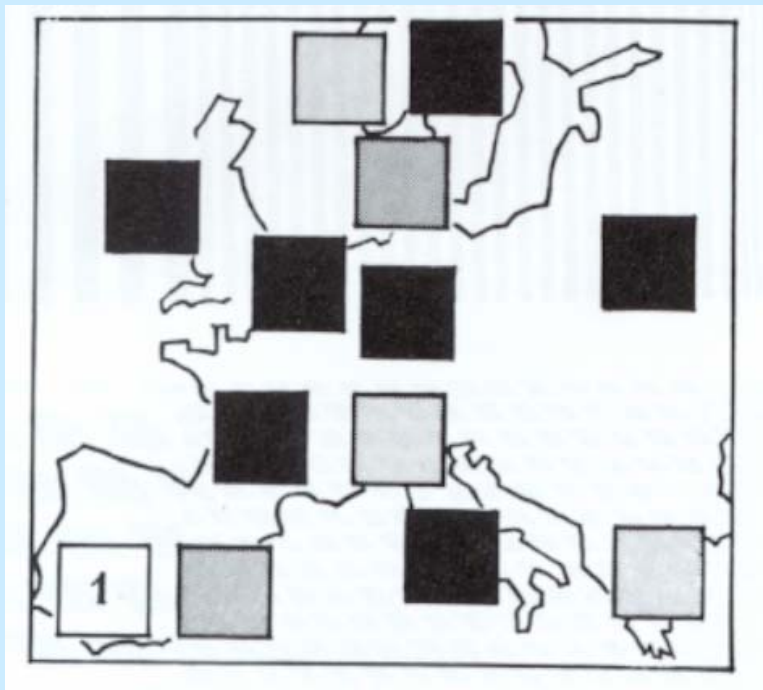

# Visual Variable: Value

- Ordered, and can not be re-ordered

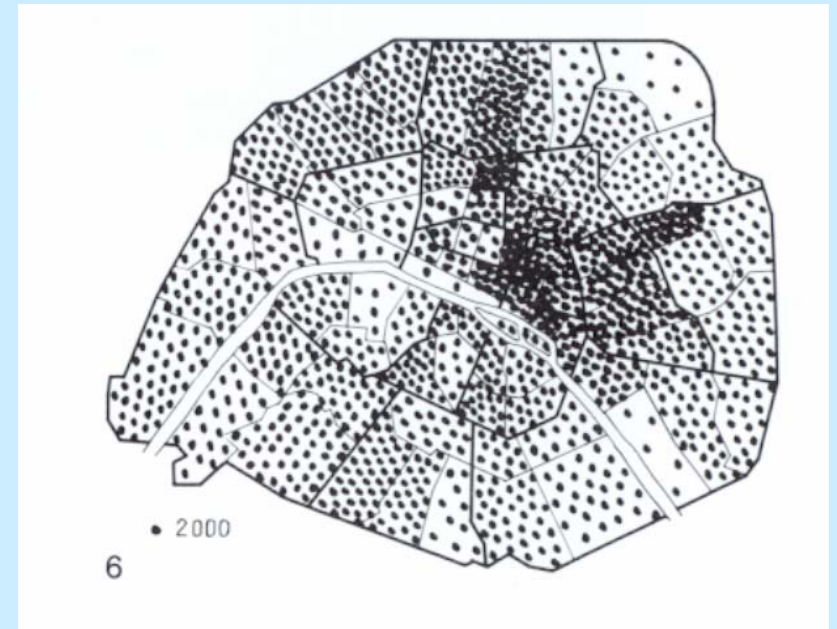

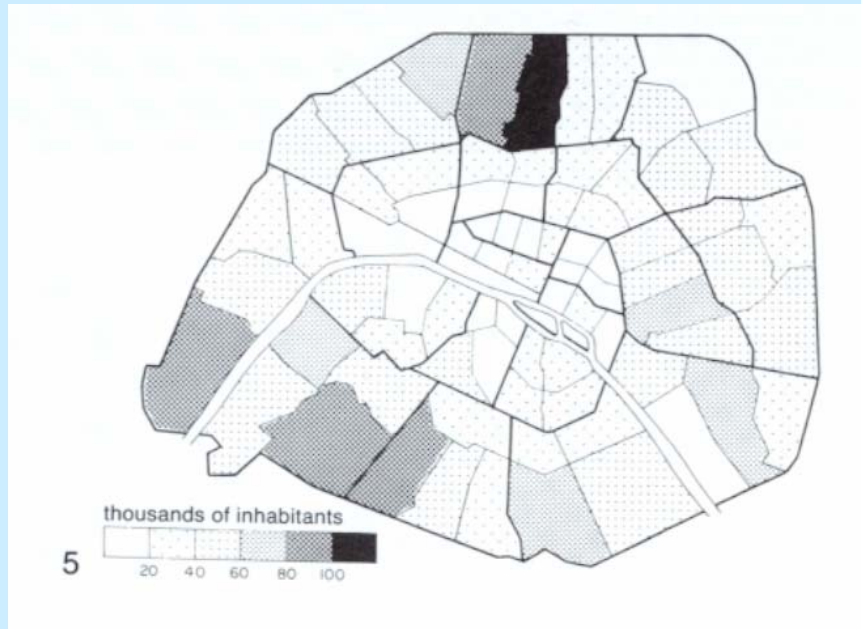

# Visual Variable: Value

- Is not quantitative  
(oil consumption in Europe base unit 1 million tons)

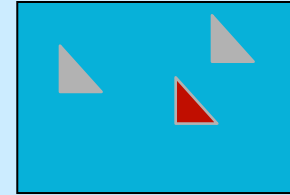

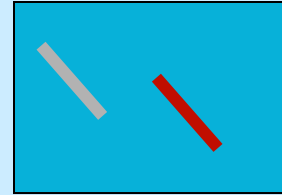

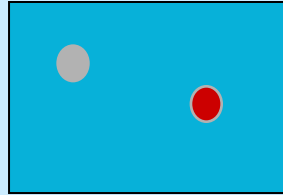

# Visual Variable: Value

- Value intensity can be mis-read as density  
(population of Paris)

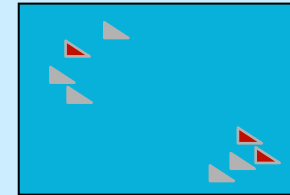

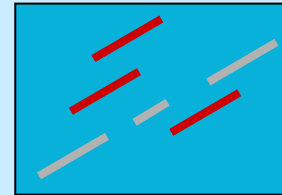

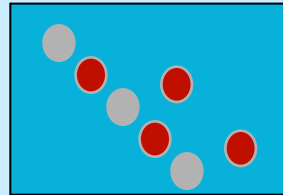

# Visual Variable: Colour

✓ • selective

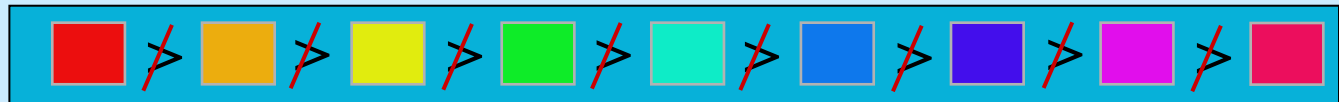

✓ • associative

≠ • quantitative

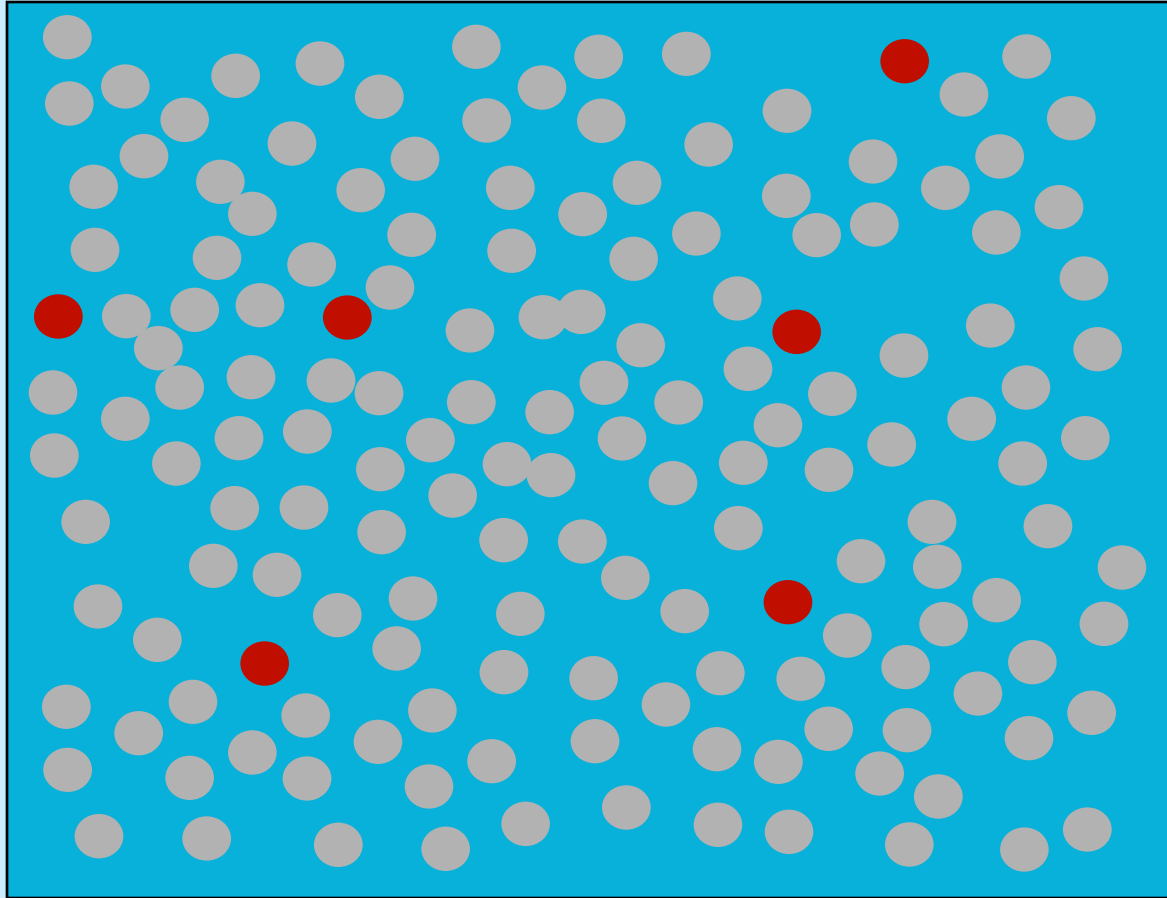

≠ • order

✓ • length

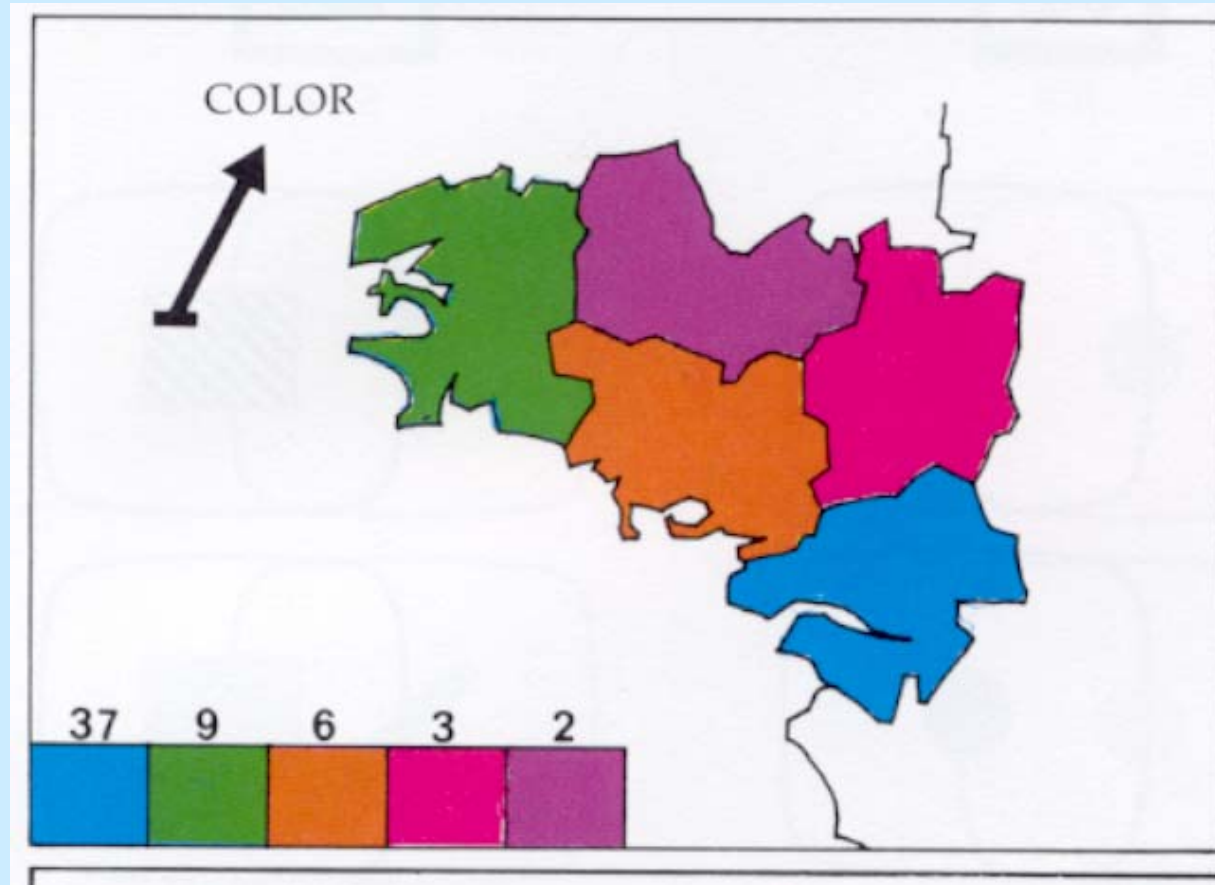

- theoretically infinite but practically limited
- association and selection  $\sim < 7$  and distinction  $\sim 10$

# Colour

# Colour

- Categories of colour,
  - changes in hue at equal value

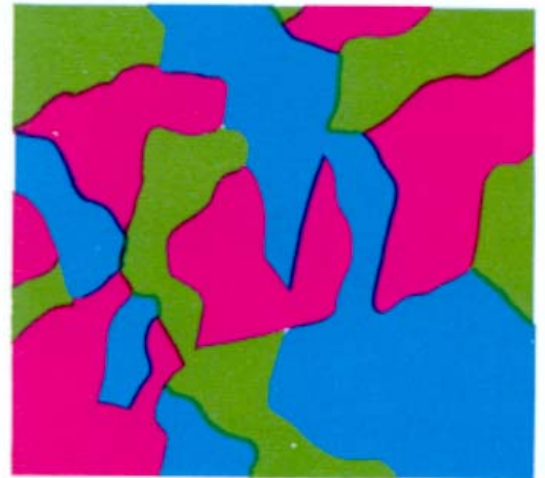

# Colour

points

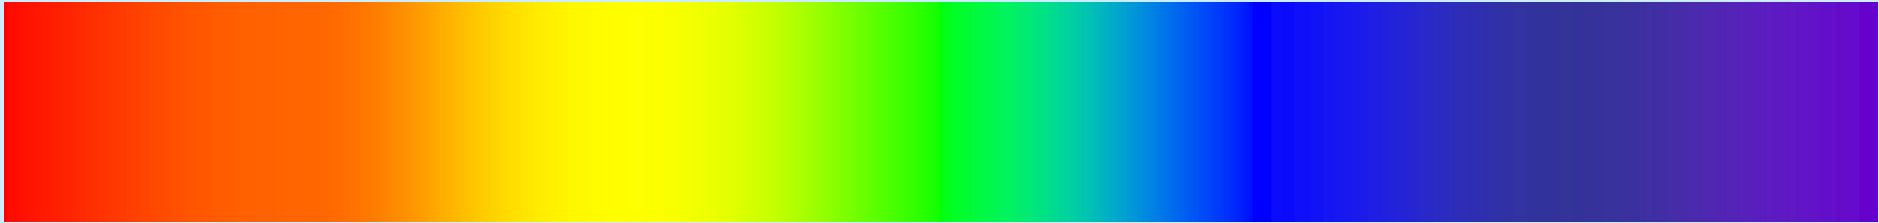

lines

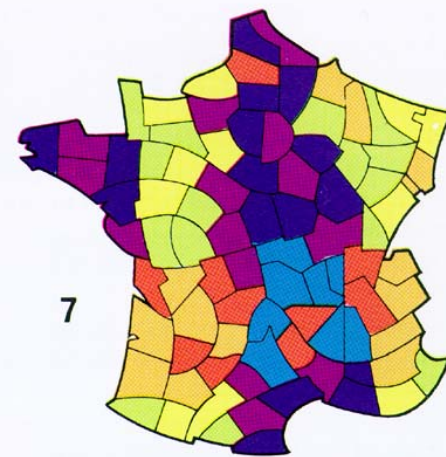

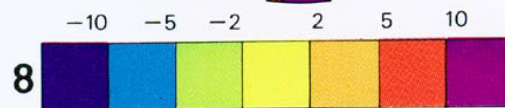

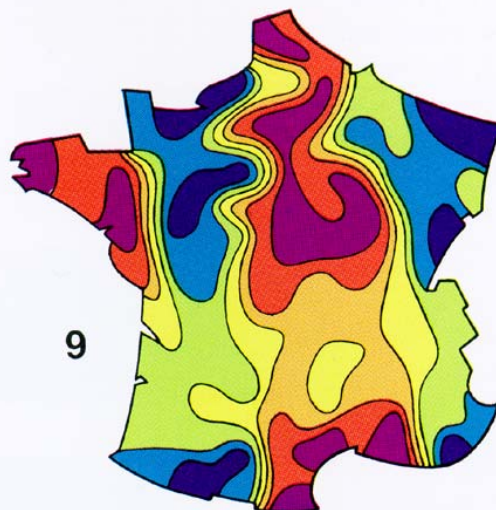

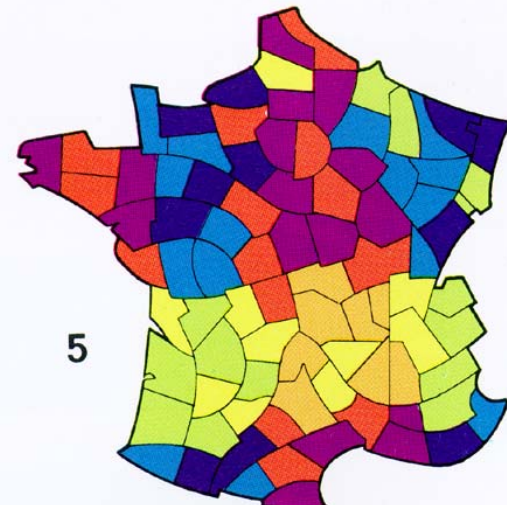

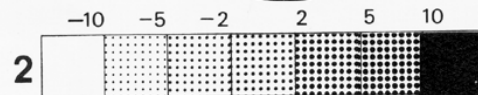

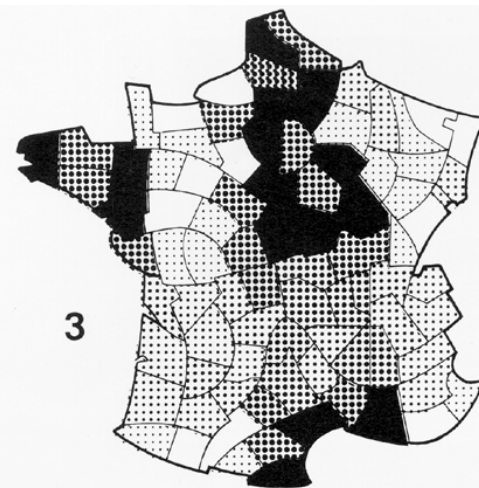

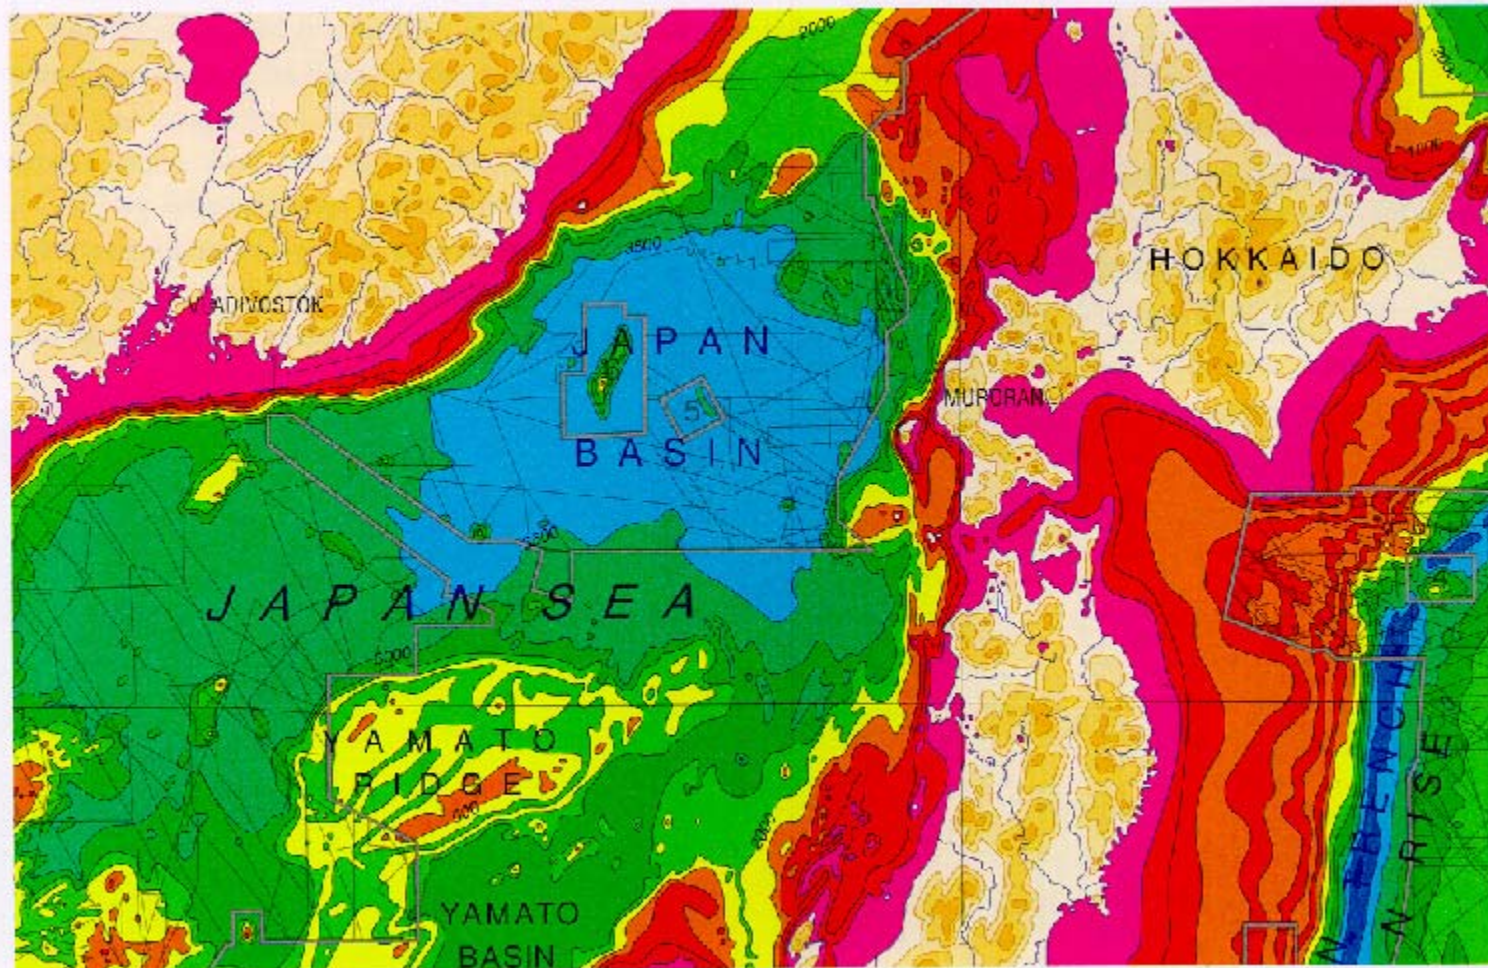

areas

# Encoding

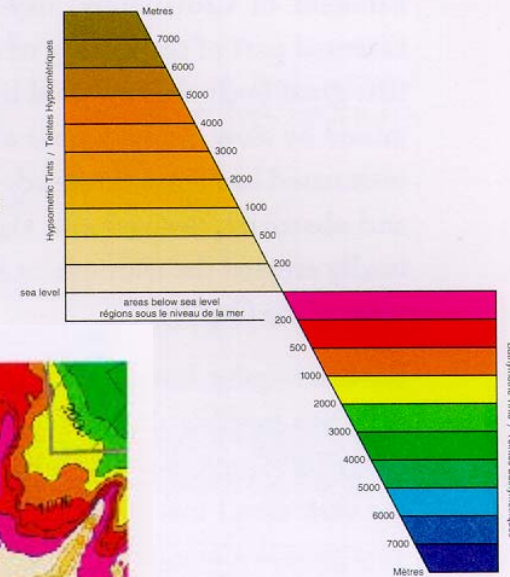

- Common advice says use a rainbow scale
  - Marcus, Murch, Healey
  - problems with rainbows

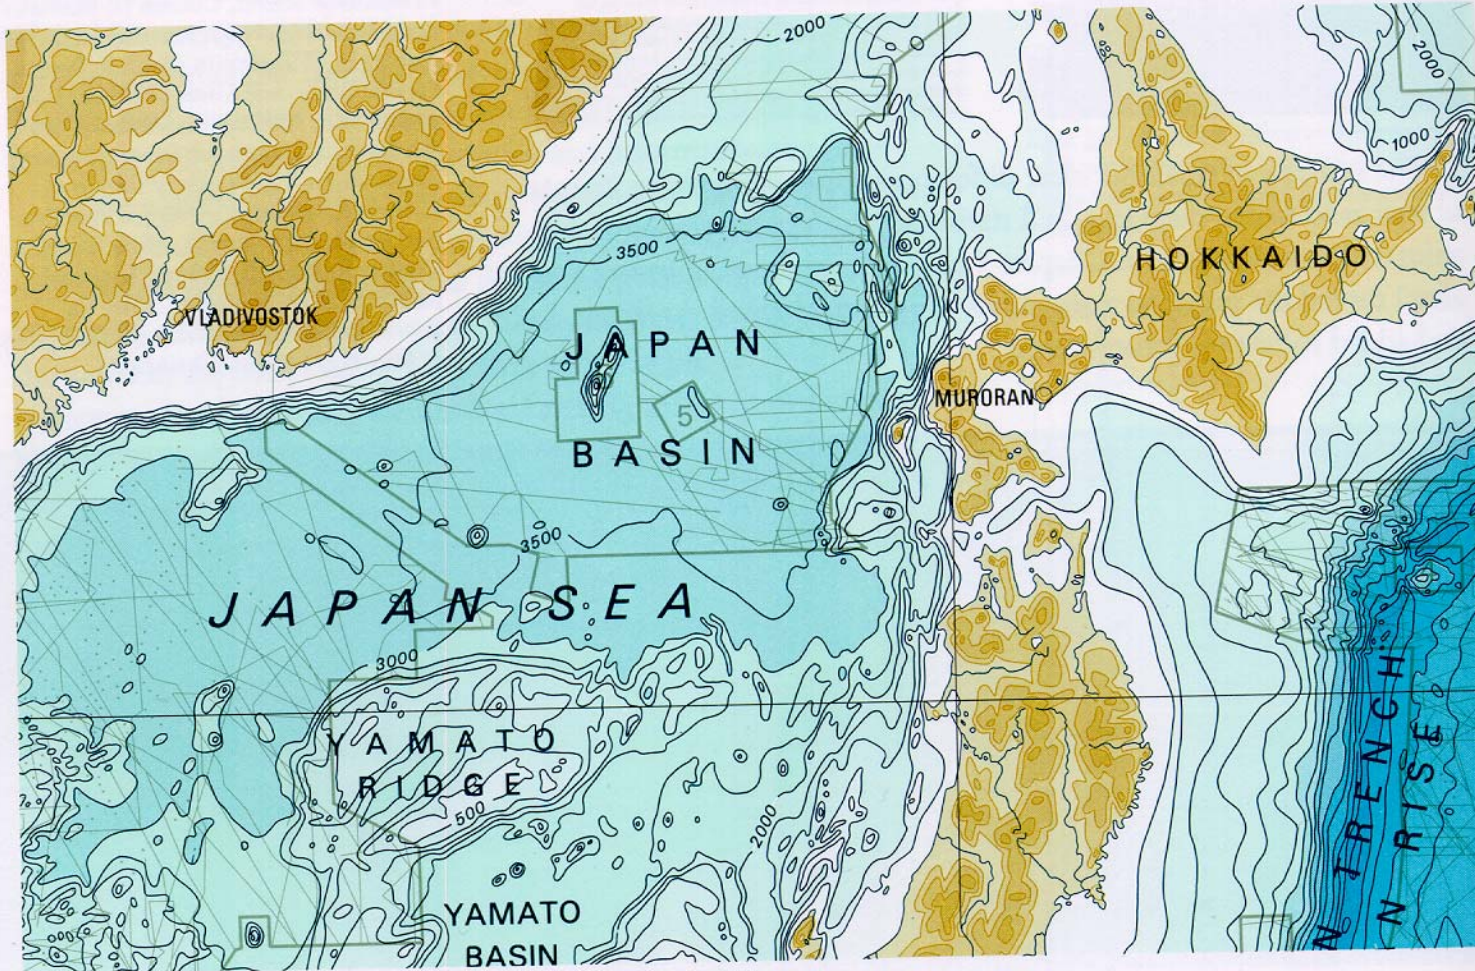

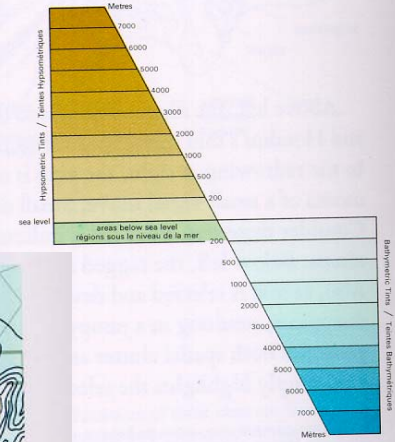

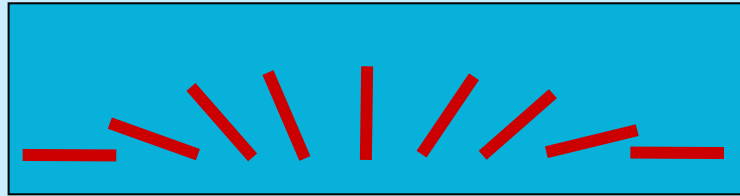

LS

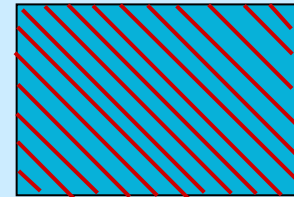

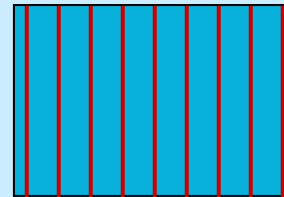

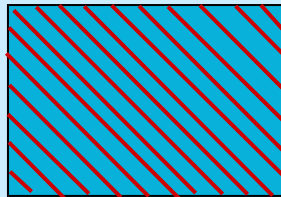

# Visual Variable: Orientation

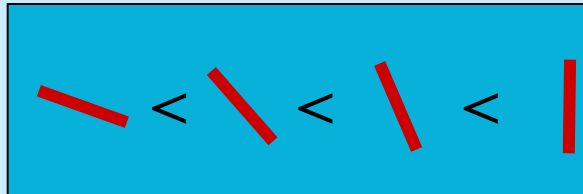

✓ • selective

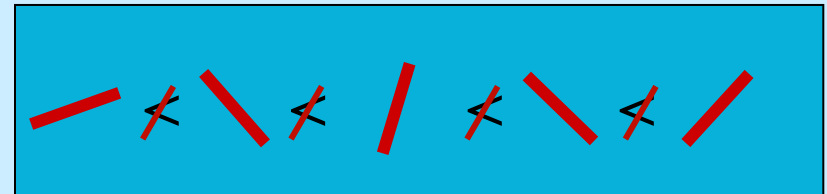

✓ • associative

≠ • quantitative

?

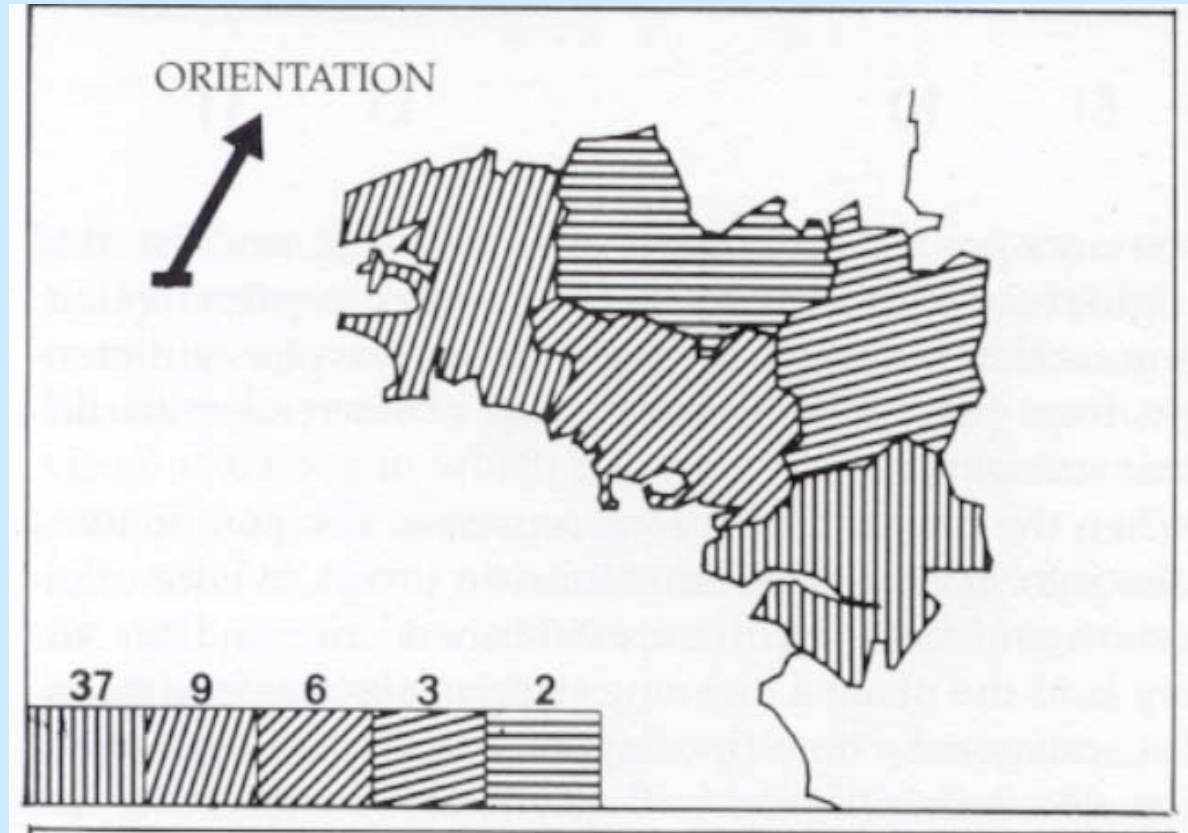

≠ • order

✓ • length

- ~5 in 2D; ? in 3D

# Orientation

- Categories of orientation,
  - variations is line or line-pattern ranging from the vertical to the horizontal

# Orientation

points

lines

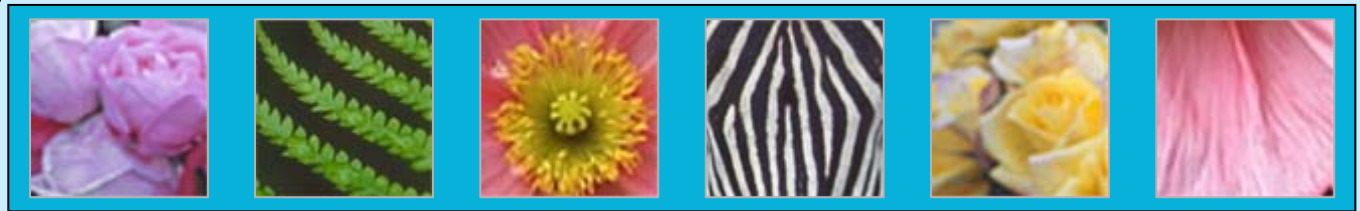

areas

# Visual Variable: Texture

- ✓ • selective

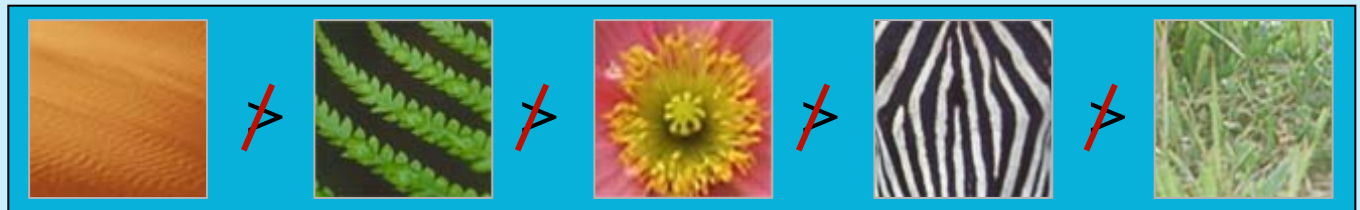

- ✓ • associative

- ~~≠~~ • quantitative

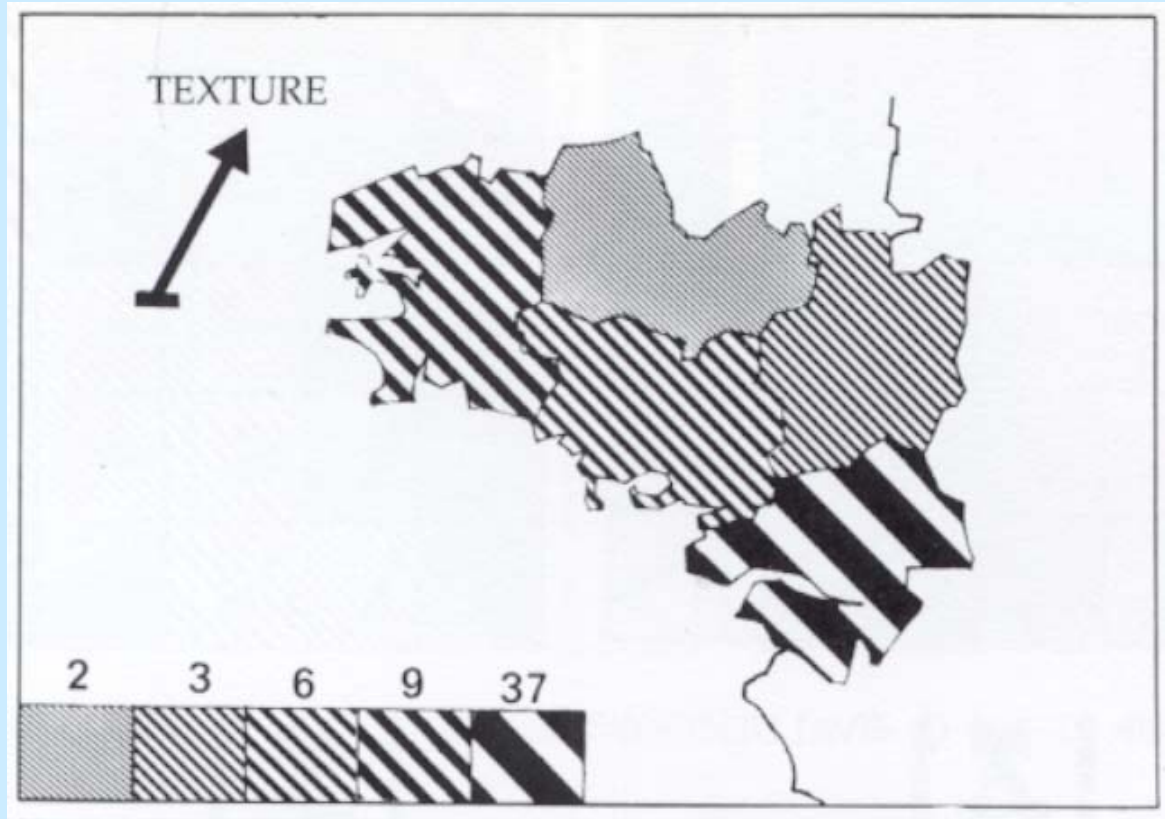

- ~~≠~~ • order

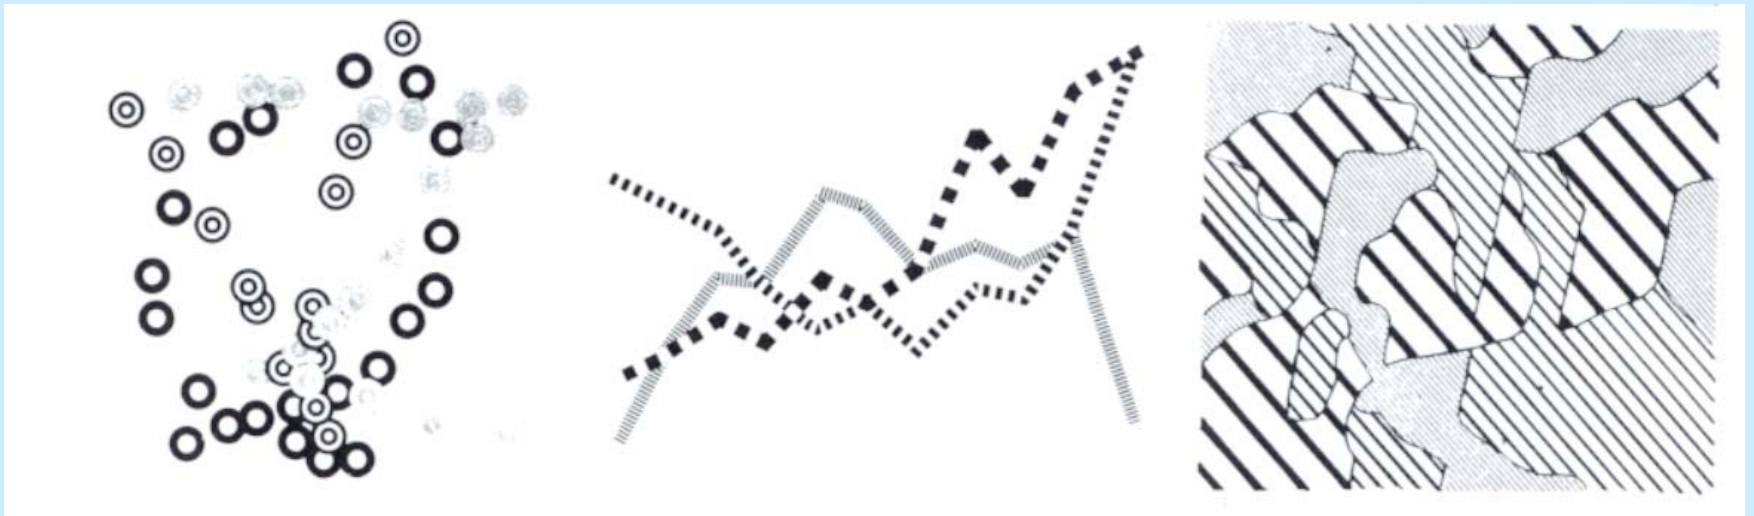

- ✓ • length
  - theoretically infinite

# Texture

- Categories of texture,
  - changes in fineness or coarseness of the marks in an area
  - can be combined changes in characteristics

# Texture

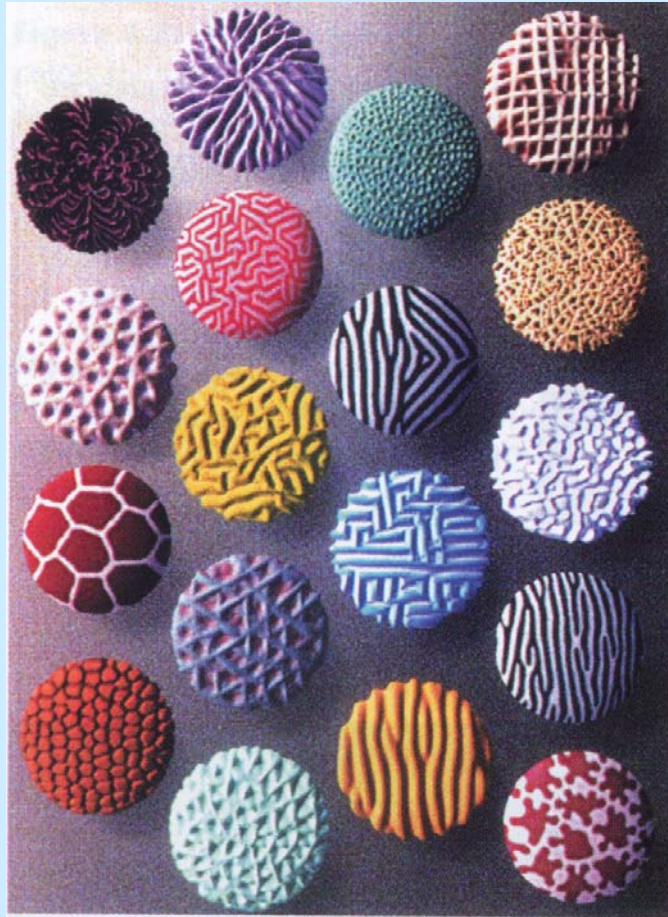

points

lines

areas

# Textures

# Visual Variable: Motion

- ✓ • Selective
  - motion is one of our most powerful attention grabbers

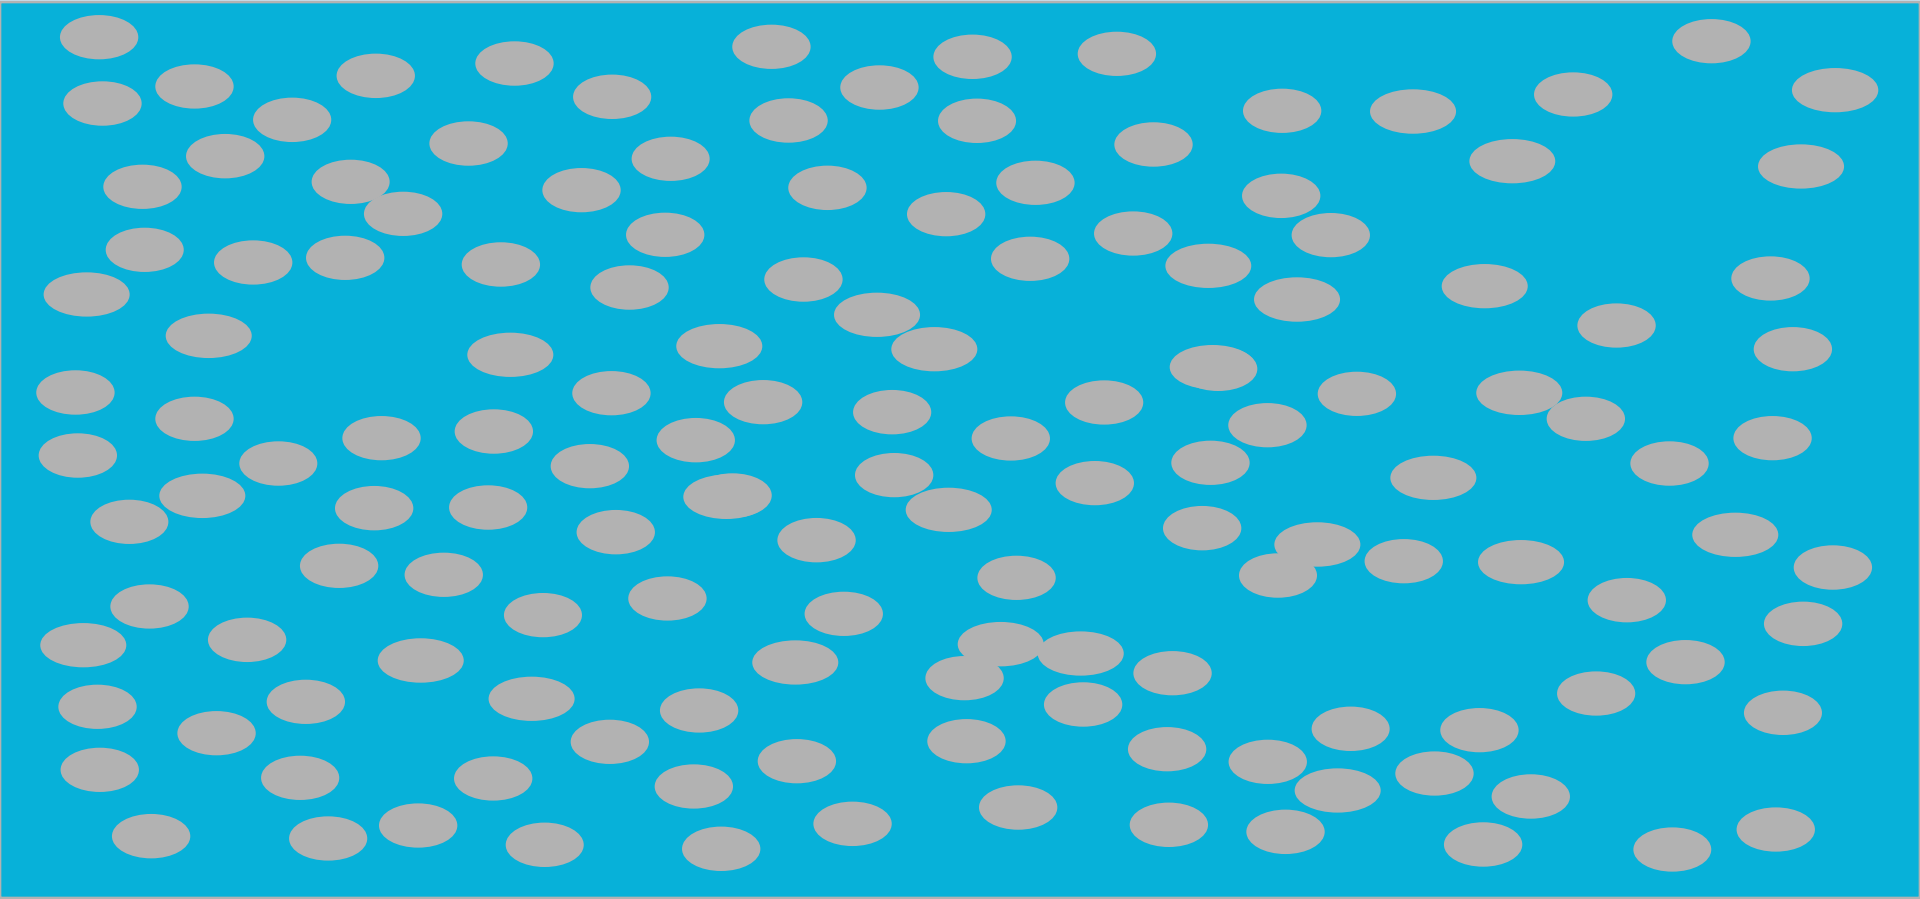

- ✓ • associative
  - moving in unison groups objects effectively

- ≠ • quantitative
  - subjective perception

- ≠ • order

- ? • length
  - distinguishable types of motion?

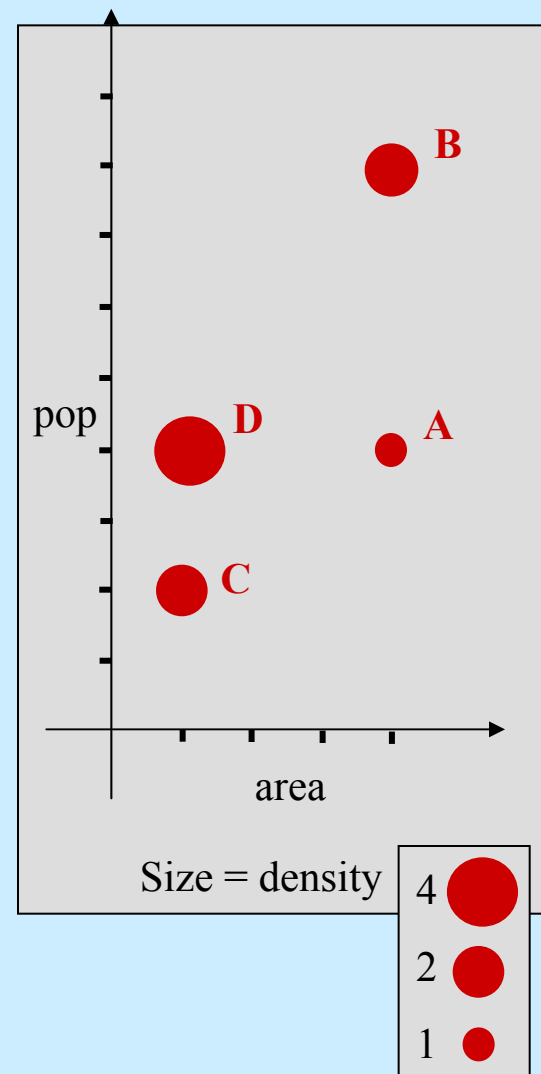

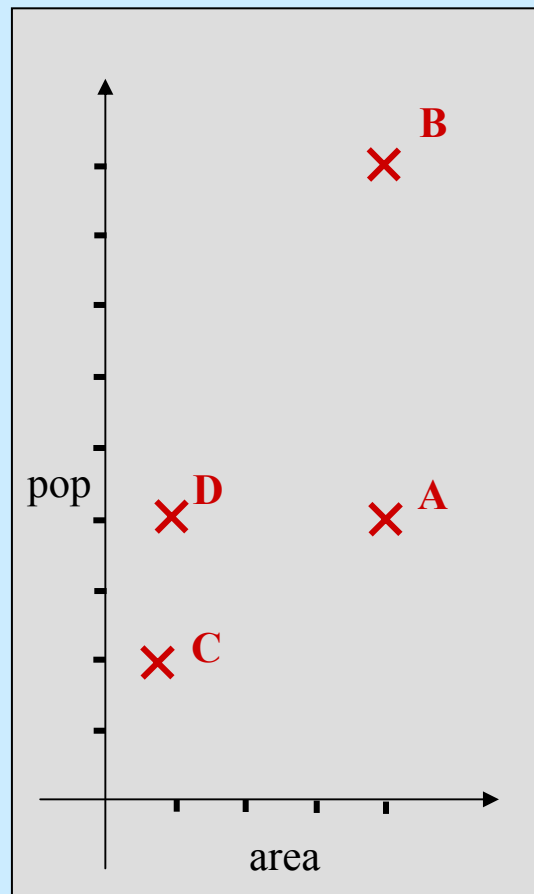

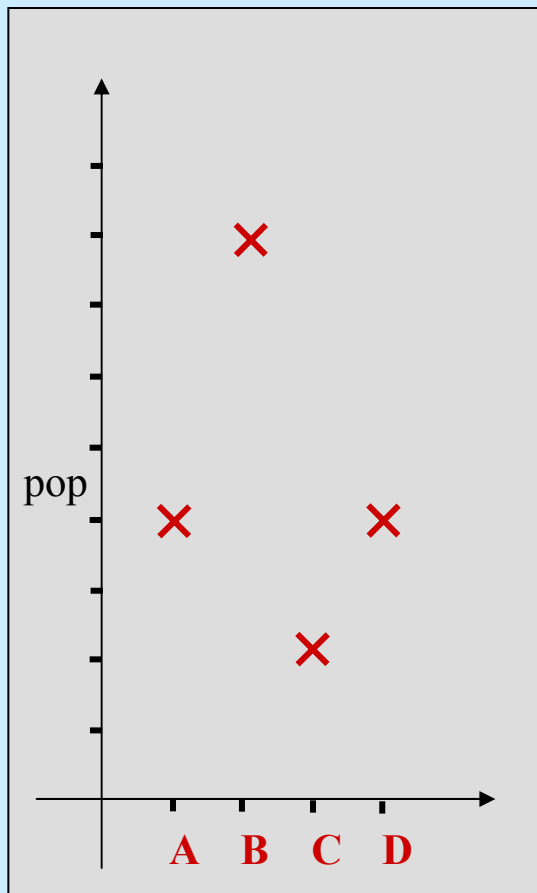

# Motion

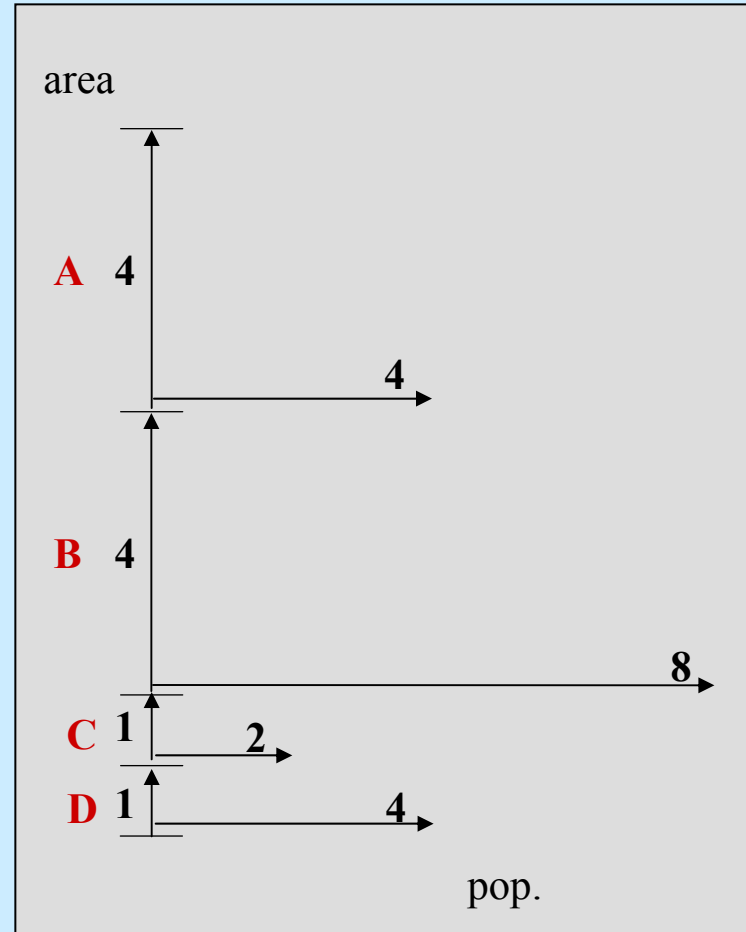

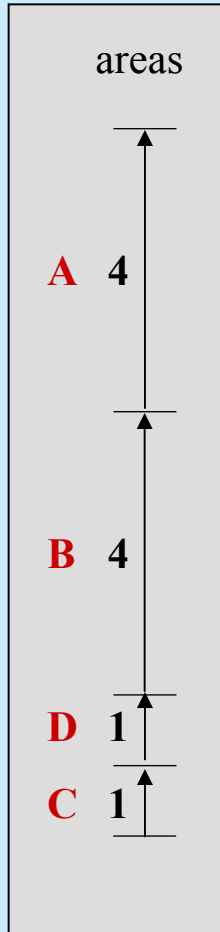

# Information from 4 French communes

The communes	A	B	C	D	
Areas	4	4	1	1	(10s of km <sup>2</sup> )
Population	4	8	2	4	(1000s of persons)
Density of pop.	1	2	2	4	(%)

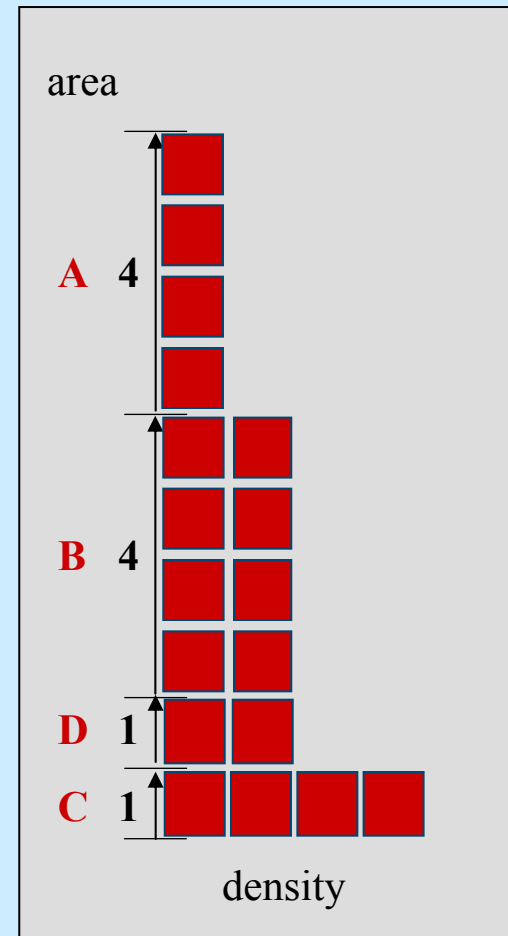

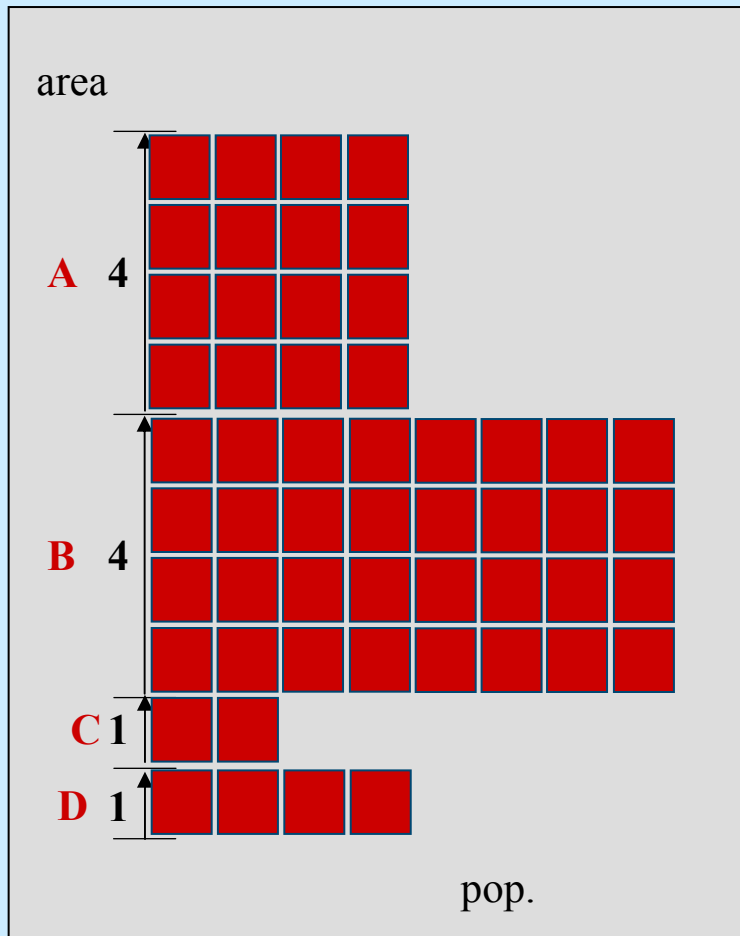

# Point Representations

# Line Representations

# Line Representations

# Area Representations

C	A
D	B

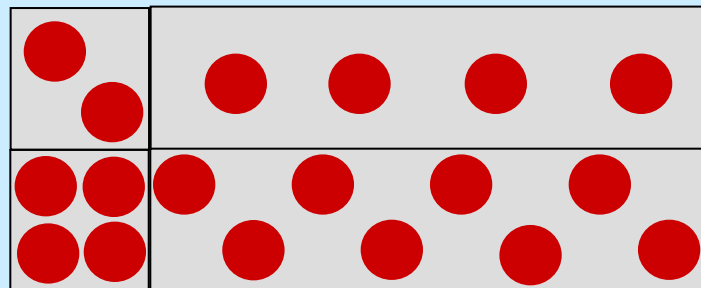

Area proportional to size

population

2	4
4	8

density of population

2	1
4	2

# Area Representations

C	C	A	A	A	A
C	C				
D	D	B	B	B	B
D	D				

Area proportional to size

population

2	2	4	4	4	4
2	2				
4	4	8	8	8	8
4	4				

density of population

2	2	1	1	1	1
2	2				
4	4	2	2	2	2
4	4				

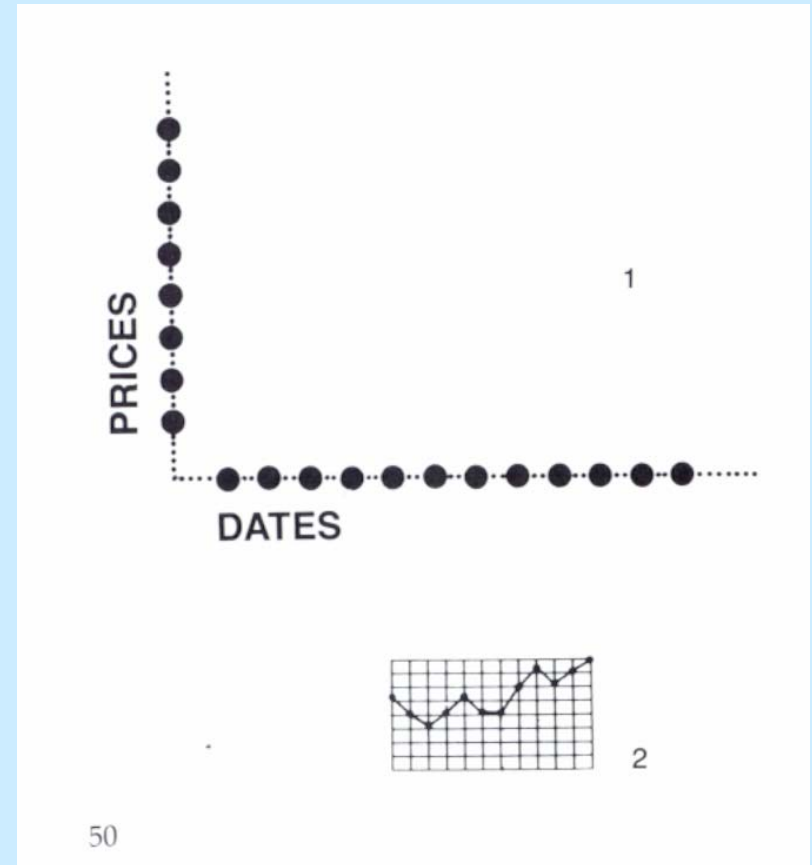

# First group: Diagrams

- When correspondences can be established **between**
  - all the divisions of **one** component and
  - all the divisions of **another**

# Second group: Networks

- When correspondences can be established **among**
  - all the divisions of the **same** component

steps

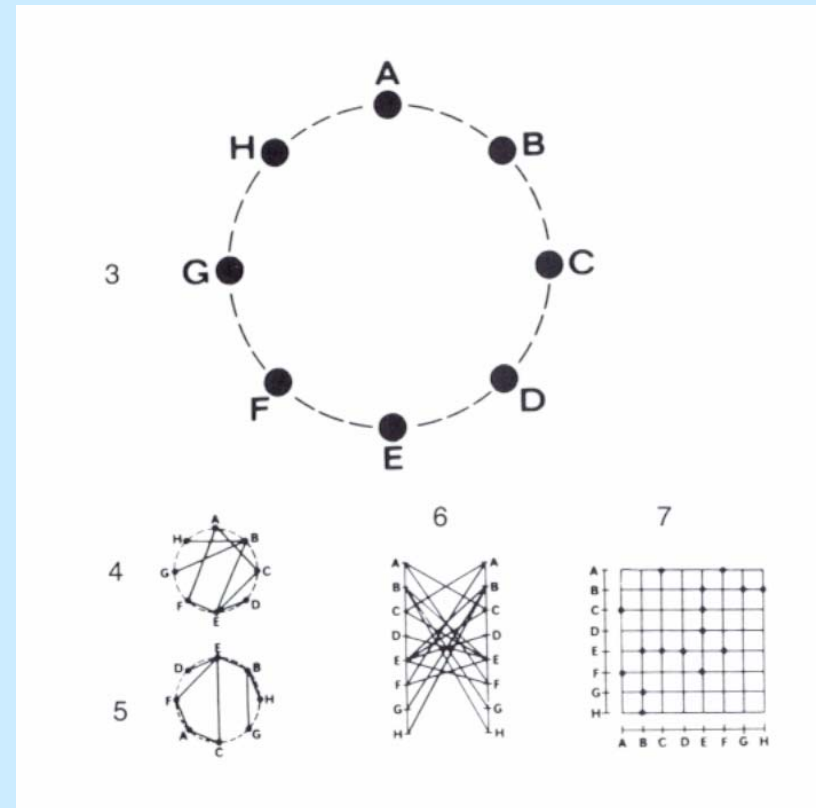

1. record correspondences
2. deduce simplest structure

fig. 3 - all components capable of conversing

fig. 4 - recording information

fig. 5 - organizing spatially

Supposing one group speaks, one listens -> diagrams such as fig. 6 or fig. 7.

# Third group: Maps

- When correspondences can be established **among**
  - all the divisions of the **same** component
  - and can be arranged according to **geometric** order

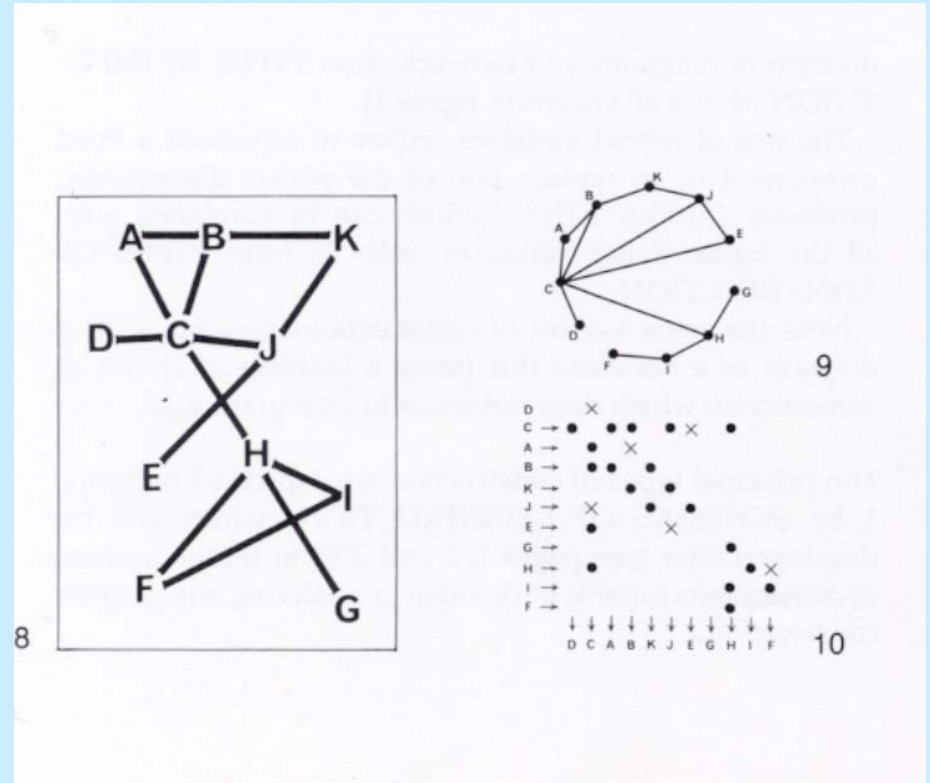

steps

1. Reproduce geometric order
2. record correspondences

fig. 9 - map of towns and roads

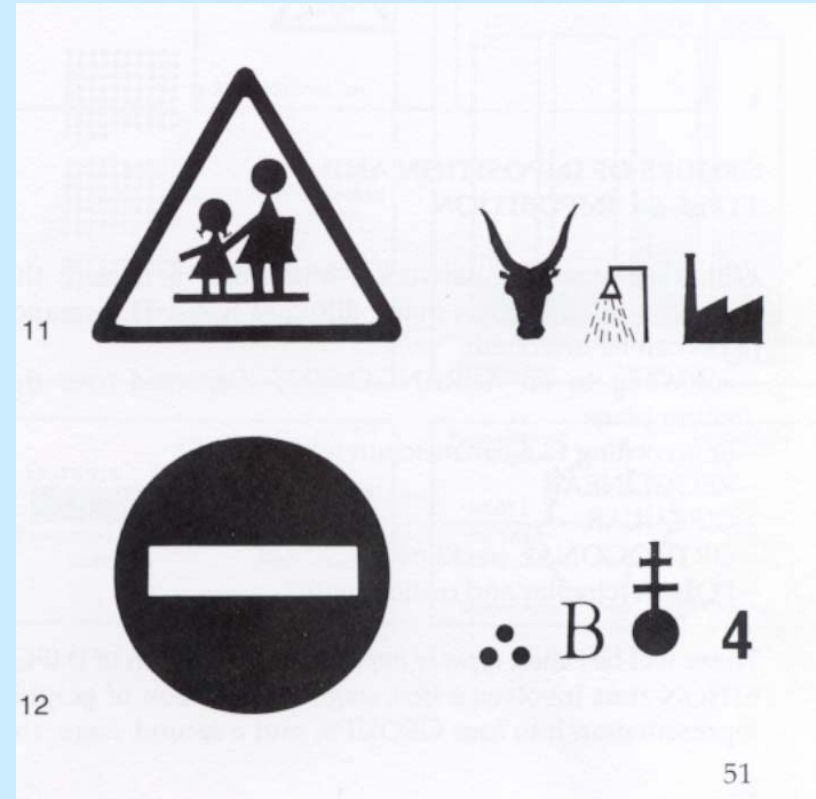

fig. 10 - network of this information

fig. 11 - diagram of this information

# Fourth group: Symbols

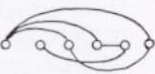

- When correspondences are **not** established in the representation but between the marks in the **representation** and the **reader**
  - learned
  - culturally tied - meaning comes from agreement
- diagrams, networks , maps support internal processing
- symbolism (language) relies on external processing

# Other groups: ?????

- Are there other basic groupings?
  - that are not just a combination of these four?
- Depiction (realistic representation)
- Historically,
  - symbolism,
  - depiction
  - maps
  - diagrams
  - networks
- question - as we go through recent work, will any constitute a new grouping, why?

# Use of Space

IMPOSITION		TYPES OF IMPOSITION				
GROUPS OF IMPOSITION		ARRANGEMENT	RECTILINEAR	CIRCULAR	ORTHOGONAL	POLAR
	DIAGRAMS		 	 	 	 
	NETWORKS	 	 	 	 	
	MAPS	 				
	SYMBOLS					

# Traffic accident victims France 1958

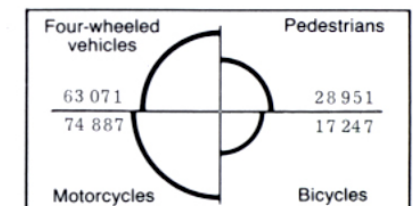

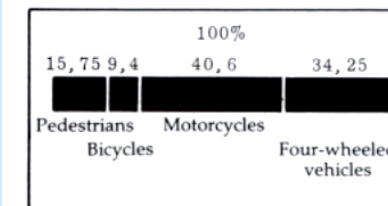

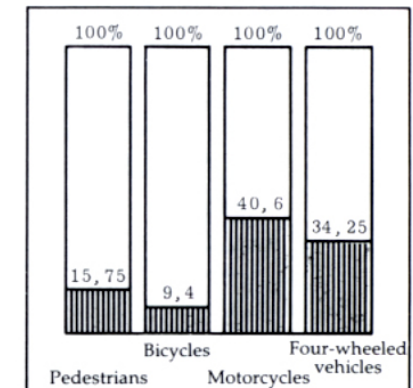

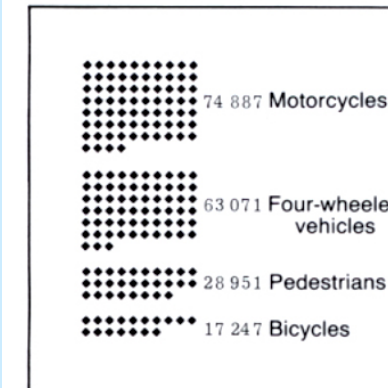

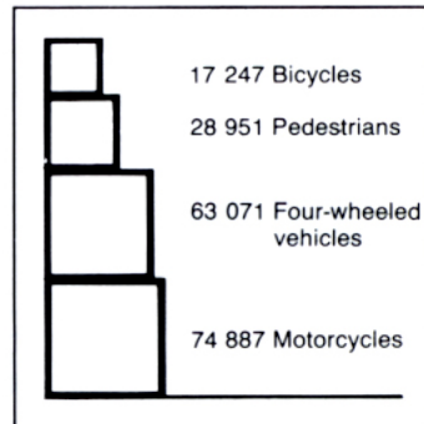

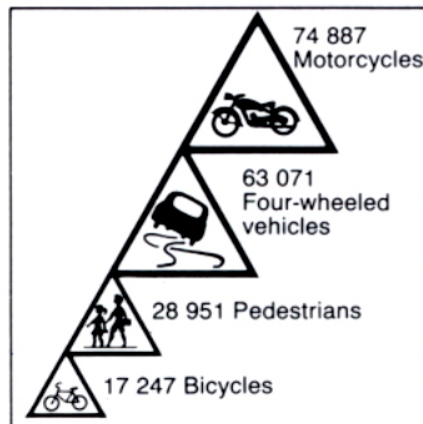

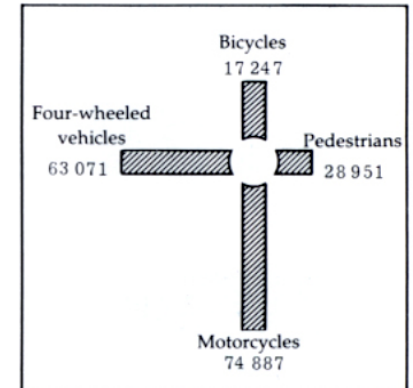

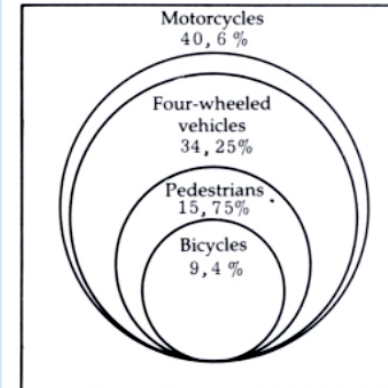

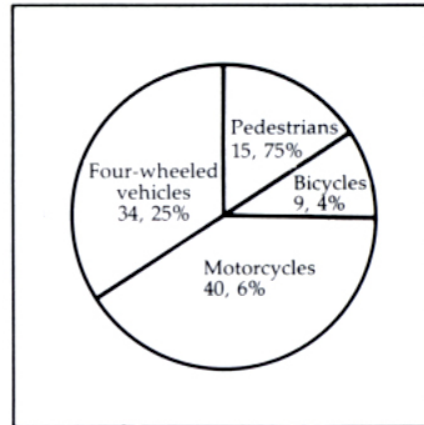

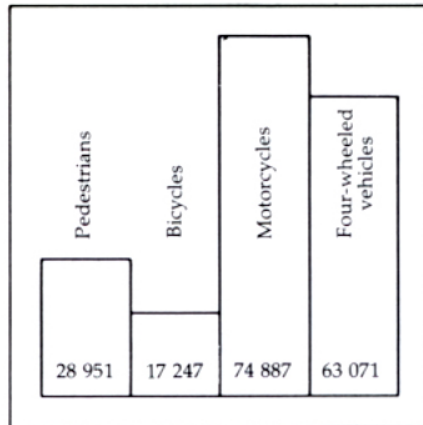

pedestrians 28,951

bicycles 17,247

motorcycles 74,887

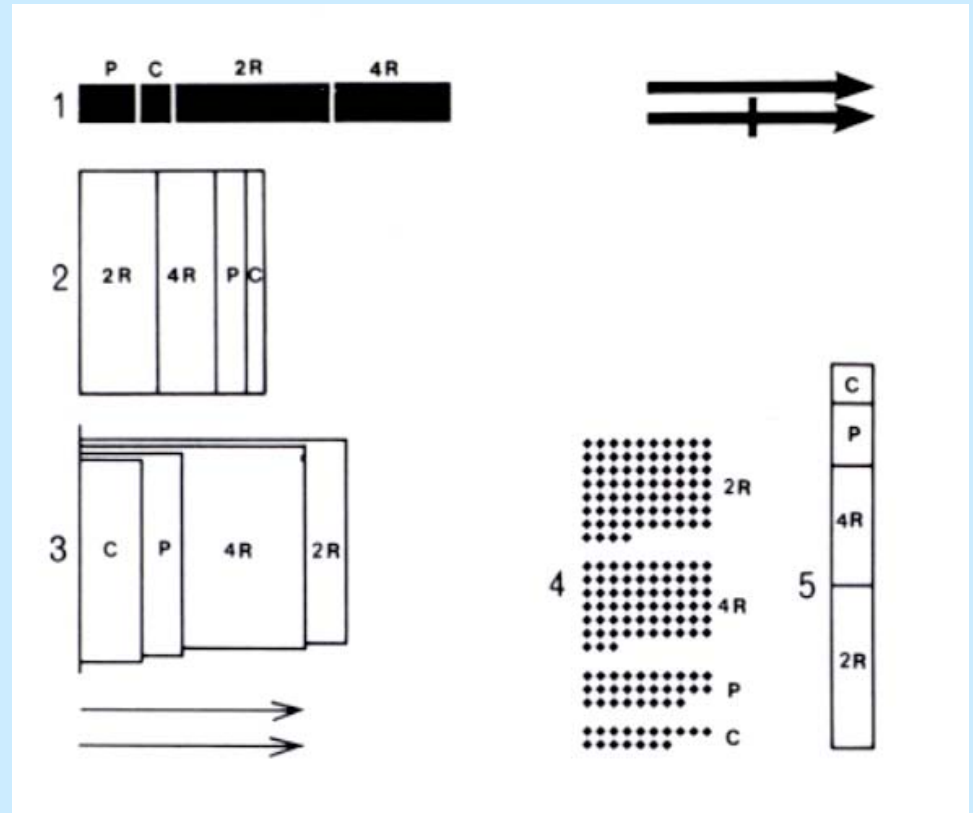

4 wheel vehicles 63,071

# Traffic accident victims France 1958

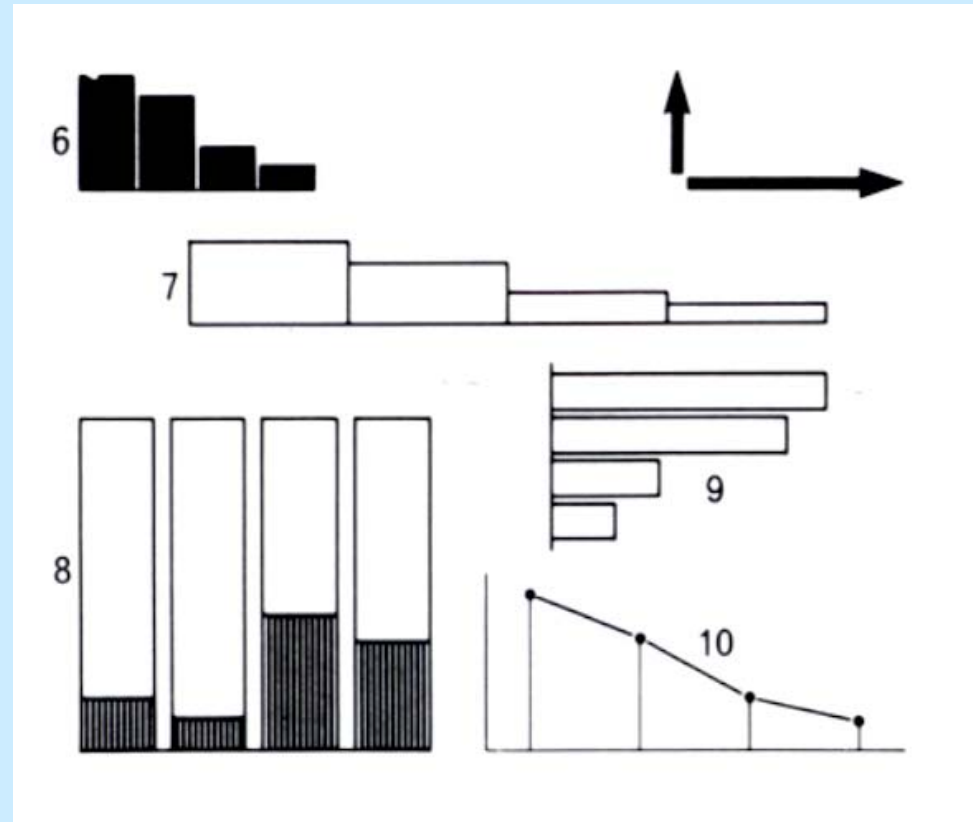

# Linear Construction

- Straight line represents the total
- quantities are shown proportionally
  - fig 1 - as given
  - fig 2 - sorted horizontal
  - fig 5 - sorted vertical
  - fig. 3 - spatially proportional - partial quantities related to same base
  - fig 4. - countable representation
- uses only 1 dimension of the plane - leaves the other free for ...

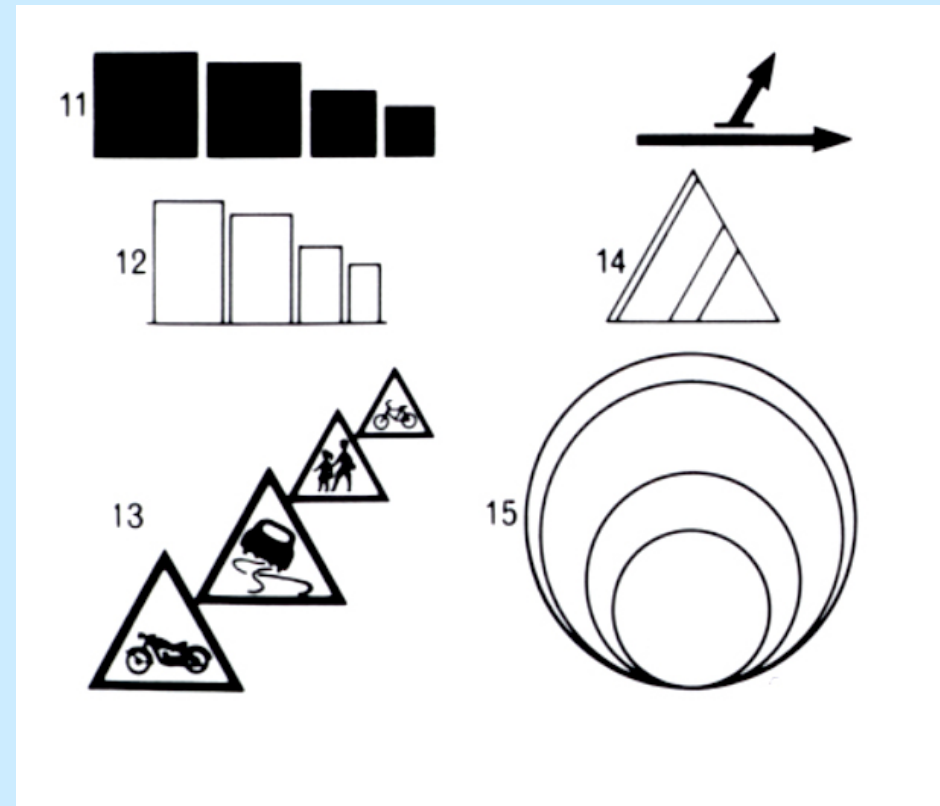

# Orthogonal Construction

- Spatial differentiation of parts
- juxtapose categories with quantity
  - fig 6, 7 - categories horizontal, quantities vertical
  - fig 9 - categories vertical
  - fig 8 - proportion as % emphasized
  - fig. 10 - linked categories ... trends
- total is not portrayed but separate quantities easier to compare

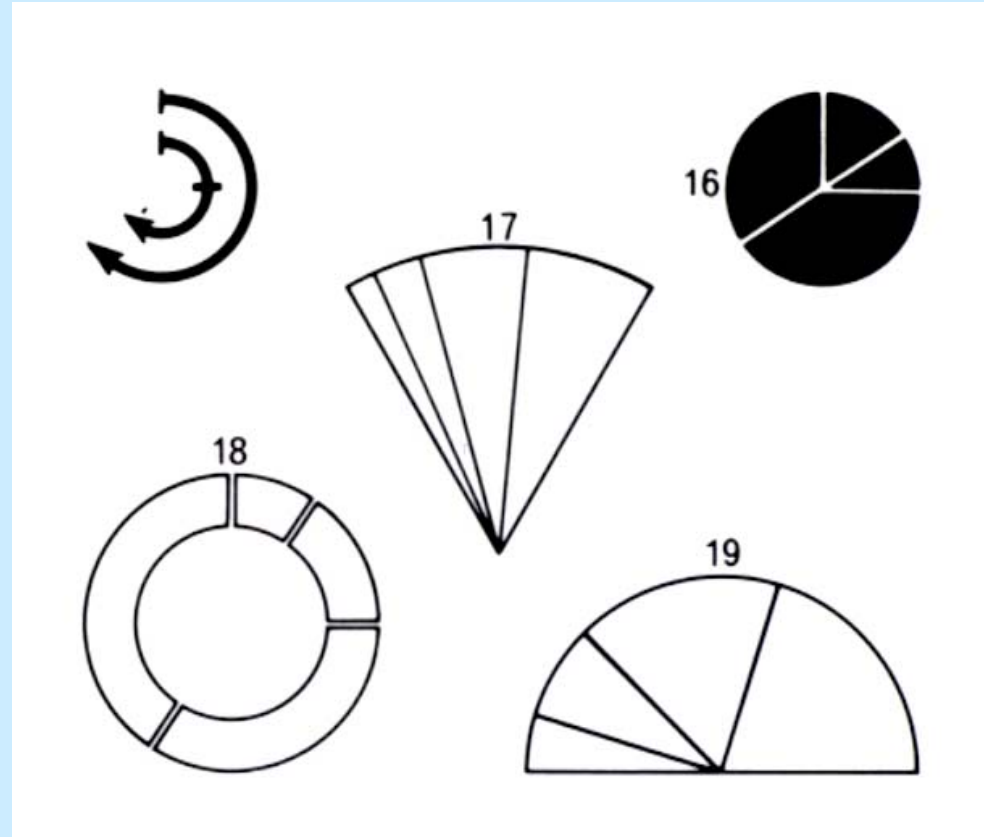

# Rectilinear Elevation

- Quantity is represented by area
- 2nd dimension is not used, variation in marks (vv -size) is used
  - fig 11, 12 - areas lined up horizontally
  - fig 13 - diagonal arrangement
  - fig 14, 15 - superimposed
- total is not portrayed but comparison of parts more difficult

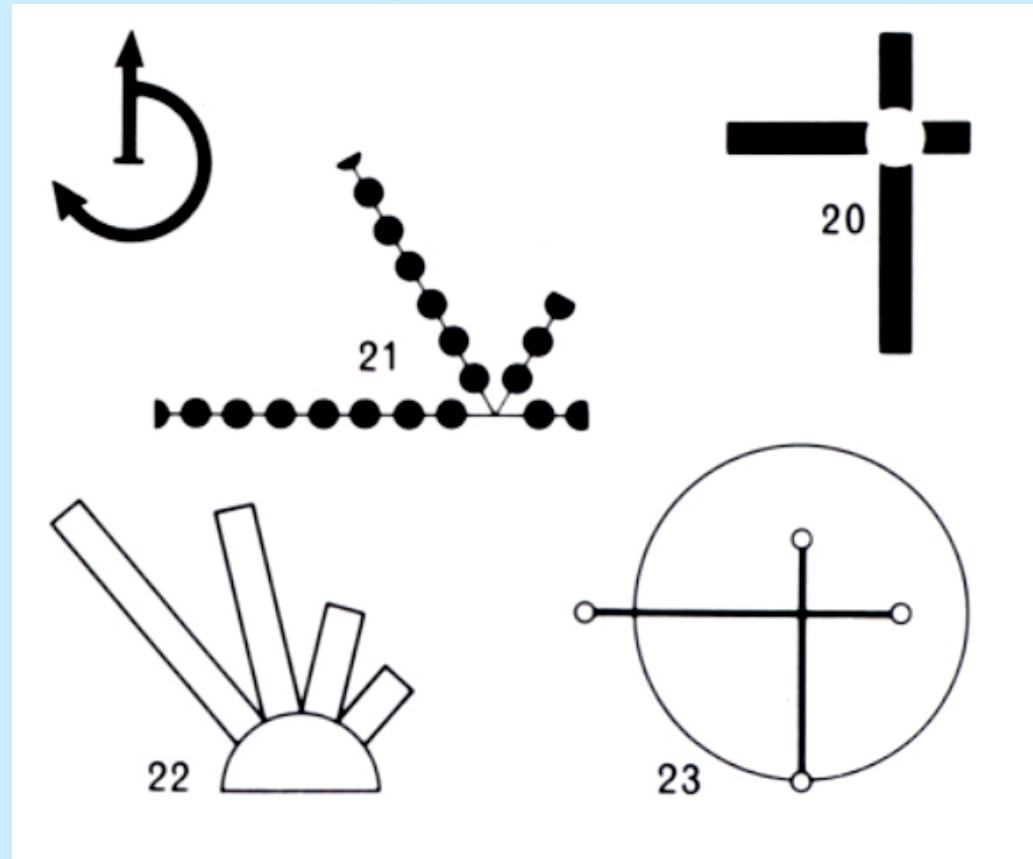

# Circular Construction

- Circular version of rectilinear construction
- total is portrayed
- amounts designated by angle at centre and length of circumference
  - fig 18, is fig. 5 curved
  - fig 16, 17, 19 - portion or whole circle
- comparing centre angles is easier than circumference lengths (fig 19 vs fig 18)

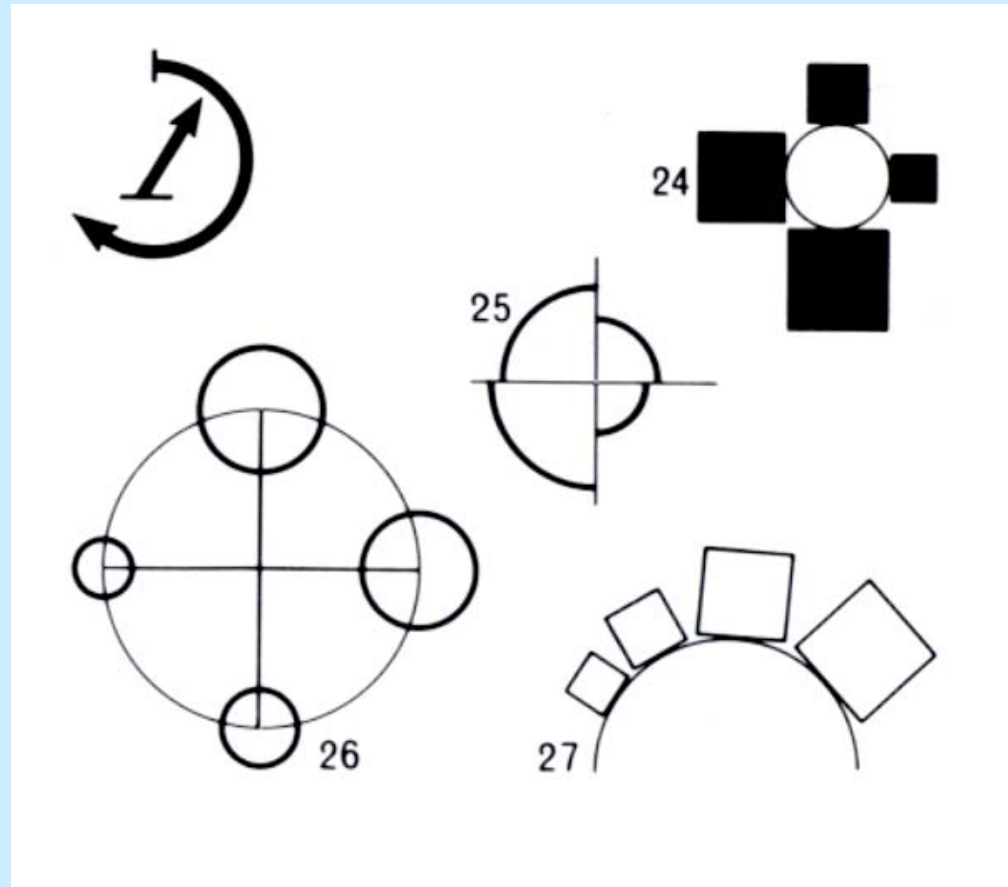

# Polar Construction

- Polar construction is a circular version of orthogonal construction
  - fig. 20, is fig. 6 curved
  - fig. 23 - visual measure of quantity added
- total not portrayed
- parts less easily comparable

# Circular Elevation

- As in rectilinear elevation areas are proportional to quantity
  - fig. 24, is fig. 11 curved
  - fig. 27 - uses area, fig 22. - uses length
  - fig. 26 area of circle, fig 23 - length of line
  - fig 25. - Nightingale Rose
